Review & Test

Mixed Review – Paper 1 241

Mixed Review – Paper 2 245

End-of-Book 1 Test 249

1 Natural Numbers

① Arithmetic sequences

- An **arithmetic sequence** is a list of numbers in which, from the second term on, each term is greater (or smaller) than the term before it by the same amount, called the **common difference**.
- Examples: 3, 7, 11, 15, ... increases with difference 4; 90, 80, 70, ... decreases with difference 10.
- When the first term, the last term and the difference are known:

$$\text{Number of terms} = (\text{Last} - \text{First}) : \text{Difference} + 1,$$

$$\text{Sum} = (\text{First} + \text{Last}) \times \text{Number of terms} : 2.$$

- The n-th term of an increasing sequence is $\text{First} + (n-1) \times \text{Difference}$; of a decreasing one, $\text{First} - (n-1) \times \text{Difference}$.

② Counting digits – Forming numbers from given digits

- There are 9 one-digit numbers (1 to 9), 90 two-digit numbers (10 to 99) and 900 three-digit numbers (100 to 999).
- **Multiplication rule:** to form a number we choose a digit for each place in turn. If the first place has m choices, the second n choices, the third p choices, ... then there are $m \times n \times p \times \ldots$ numbers in all.
- The digit 0 cannot be the leading digit. If the digits must be *different*, a digit already used cannot be chosen again.
- To add up all the numbers formed, count *how many times each digit appears in each place.*

③ Place value: writing an extra digit onto a number

Writing numbers by place value links the old number to the new one. For a two-digit number $\overline{ab}$:

- writing a digit c on the **right**: $\overline{abc} = \overline{ab} \times 10 + c$ (ten times the old number, plus c);

- writing a digit c on the **left**: $\overline{cab} = c \times 100 + \overline{ab}$;
- writing 0 **in the middle**: $\overline{a0b} = a \times 100 + b$.

Example 1

Consider the arithmetic sequence 3, 7, 11, 15, ..., 199.

a) How many terms does it have?

b) Find the sum of all its terms.

Guided solution.

The common difference is $7 - 3 = 4$.

a) Number of terms: $(199 - 3) : 4 + 1 = 50$.

b) Sum of the terms: $(3 + 199) \times 50 : 2 = 5\,050$.

Remember: pair the first term with the last, the second with the second-to-last,... every pair adds up to 202, and there are $50 : 2 = 25$ pairs.

Example 2

How many digits are needed to number the pages of a 234-page book, starting from page 1?

Guided solution.

Split the pages into three groups by the number of digits:

Pages 1 to 9: 9 pages, using $9 \times 1 = 9$ digits.

Pages 10 to 99: 90 pages, using $90 \times 2 = 180$ digits.

Pages 100 to 234: $234 - 100 + 1 = 135$ pages, using $135 \times 3 = 405$ digits.

Total: $9 + 180 + 405 = 594$ digits.

Example 3

Using the digits 0, 3, 5, 9, how many three-digit numbers can be formed? How many with three different digits?

Guided solution.

Let the number be $\overline{abc}$ ($a \neq 0$).

Digits may repeat: a has 3 choices $(3, 5, 9)$, b has 4, c has 4.

That gives $3 \times 4 \times 4 = 48$ numbers.

Different digits: a has 3 choices; b must differ from a, so 3 choices (now 0 is allowed); c must differ from both, so 2 choices.

That gives $3 \times 3 \times 2 = 18$ numbers.

Example 4

Find the sum of all three-digit numbers with different digits that can be formed from 2, 3, 5, 7.

Guided solution.

There are $4 \times 3 \times 2 = 24$ numbers.
The four digits play the same role, so in each place every digit appears $24 : 4 = 6$ times.
The digits in each place add up to $(2 + 3 + 5 + 7) \times 6 = 102$.
Hence the required sum is:

$$102 \times 100 + 102 \times 10 + 102 \times 1 = 102 \times 111 = 11\,322.$$

Example 5

Find a two-digit number such that writing the digit 5 on its right gives a new number that is 293 more than it.

Guided solution.

Let the number be $\overline{ab}$.
Writing 5 on the right gives $\overline{ab5} = \overline{ab} \times 10 + 5$.
By the problem: $\overline{ab} \times 10 + 5 = \overline{ab} + 293$.
Take $\overline{ab}$ from both sides: $\overline{ab} \times 9 + 5 = 293$, so $\overline{ab} \times 9 = 288$ and $\overline{ab} = 32$.
Check: $325 - 32 = 293$.
So the number is 32.

Practice

Problem 1

Consider the sequence 2, 5, 8, 11, 14, ...

a) State the rule and write the next three terms.

b) Find the 100th term.

c) Do 2 024 and 2 025 belong to the sequence? If so, which term is it?

Your work:

Problem 2

For the sequence 4, 9, 14, 19, ..., 499, find the number of terms and their sum.

Your work:

Problem 3

Find the sum of 80 consecutive natural numbers starting from 25.

Your work:

Problem 4

Find the sum of the first 40 terms of the sequence 3, 7, 11, 15, ...

Your work:

Problem 5

Find the sum of all odd two-digit numbers.

Your work:

Problem 6

How many digits are needed to number the pages of a 208-page storybook, starting from page 1?

Your work:

Problem 7

Exactly 435 digits were used to number the pages of a book, starting from page 1. How many pages does the book have?

Your work:

Problem 8

Writing the natural numbers one after another from 1 gives $A = 123456789101112\ldots$ What is the 150th digit of A, and which number does it belong to?

Your work:

Problem 9

Using the digits 1, 4, 6, 9, how many natural numbers can be written that

a) have three digits? **b)** have three different digits? **c)** have three different digits and are even?

Your work:

Problem 10

Using the digits 0, 2, 5, 7, how many three-digit numbers can be written? How many with three different digits?

Your work:

Problem 11

Using the digits 0, 1, 3, 6, 8, how many four-digit numbers with different digits can be written? How many of them are even?

Your work:

Problem 12

Find the sum of all three-digit numbers with different digits formed from 1, 3, 5, 7.

Your work:

Problem 13

How many three-digit numbers contain exactly one digit 5?

Your work:

Problem 14

How many four-digit numbers with different digits have 3 as the thousands digit?

Your work:

Problem 15

Find a two-digit number such that writing 4 on its right gives a number 571 more than it.

Your work:

Problem 16

Find a three-digit number such that writing 9 on its right gives a number 1 350 more than it.

Your work:

Problem 17

Find a three-digit number such that writing 4 on its left gives a number 17 times as large.

Your work:

Problem 18

Find a two-digit number such that writing 0 between its two digits gives a number 7 times as large.

Your work:

Problem 19

Consider 5, 10, 15, ..., 500. How many terms are there? Find their sum.

Your work:

Problem 20

Consider 1, 4, 7, 10, ... **a)** Find the 50th term. **b)** Is 2 026 a term? If so, which one?

Your work:

Problem 21

Find the sum of the even numbers from 2 to 200.

Your work:

Problem 22

Find the sum of all three-digit multiples of 10.

Your work:

Problem 23

How many two-digit numbers are multiples of 3?

Your work:

Problem 24

How many digits are needed to number the pages of a 120-page book, starting from page 1?

Your work:

Problem 25

A street has 75 houses numbered 1 to 75. How many digits are used to number them?

Your work:

Problem 26

Using the digits 2, 4, 6, write every three-digit number with different digits, then add them up.

Your work:

Problem 27

Using 1, 2, 3, 4, how many two-digit numbers with different digits can be written?

Your work:

Problem 28

Find a two-digit number that increases by 362 when the digit 2 is written on its right.

Your work:

Problem 29

Find a three-digit number such that writing 1 on its left gives a number 9 times as large.

Your work:

Problem 30

A whole number ends in 7. Crossing out that 7 makes it 1 789 smaller. Find the number.

Your work:

Challenge – Extension

Problem 31 ★

Using 1, 2, 5, 8, 9, how many four-digit numbers with different digits have the digits 2 and 5 next to each other?

Your work:

Problem 32 ✷

A three-digit number has hundreds digit 7. Moving this 7 to the far right gives a number 324 less than the original. Find the number.

Your work:

Problem 33 ✷

Find a two-digit number such that writing 12 between its two digits gives a number 76 times as large.

Your work:

Problem 34 ✷

Writing the even numbers one after another from 2 gives 2468101214... What is the 200th digit?

Your work:

Problem 35 *

An increasing arithmetic sequence has 30 terms, first term 9, and sum 2 445. Find its common difference and its last term.

Your work:

Problem 36 **

Find the largest natural number with all digits different whose digit sum is 20.

Your work:

Problem 37 *

An writes the natural numbers from 1 to 100 on the board. How many times does An write the digit 1?

Your work:

Problem 38 *

Find the whole number n such that $1 + 2 + 3 + \cdots + n = 210$.

Your work:

Problem 39 *

In 1, 3, 6, 10, 15, ... each term is the previous one plus its position number. Find the 20th term.

Your work:

Problem 40 *

Find $S = 1 + 2 + 4 + 8 + 16 + \cdots + 512$ (each term is double the one before).

Your work:

Problem 41 *

Writing the numbers 1 to 50 one after another gives a long number. **a)** How many digits does it have? **b)** What is its 50th digit from the left?

Your work:

Problem 42 *

How many three-digit numbers have digits adding up to 5?

Your work:

Problem 43

How many three-digit numbers are multiples of 5?

Your work:

Problem 44

Using 0, 1, 2, 3, 4, how many even three-digit numbers with different digits can be written?

Your work:

Problem 45

Find every two-digit number that is 4 times the sum of its digits.

Your work:

Problem 46

A two-digit number has digits adding up to 10. Swapping its digits gives a number 36 larger. Find it.

Your work:

Problem 47 *

1 092 digits are used to number the pages of a book from page 1. How many pages are there?

Your work:

Problem 48 **

Writing the numbers 1 to 200, how many times is the digit 2 written?

Your work:

Problem 49 **

Find the smallest whole number whose digits add up to 30.

Your work:

Problem 50 **

Five consecutive whole numbers add up to 2 025. Find them.

Your work:

2 Fractions and Mixed Numbers

① Fractions – the basic property

- A fraction has the form $\frac{a}{b}$, where $a,\ b$ are natural numbers and $b \neq 0$; a is the **numerator**, b the **denominator**. The quotient $a : b$ is the value of the fraction $\frac{a}{b}$.
- **Basic property:** multiplying (or dividing) the numerator and the denominator by the same non-zero number gives an equal fraction:

$$\frac{a}{b} = \frac{a \times n}{b \times n} = \frac{a : m}{b : m} \qquad (n,\ m \neq 0).$$

- This lets us **simplify** a fraction (to lowest terms) and bring fractions to a **common denominator**.
- Two fractions are equal, $\frac{a}{b} = \frac{c}{d}$, exactly when $a \times d = b \times c$ (cross-multiplying).

② Mixed numbers

When the numerator of $\frac{a}{b}$ is larger than the denominator, divide a by b to get a quotient q and a remainder r $(0 \leq r < b)$. Then

$$\frac{a}{b} = q\frac{r}{b} \quad \text{(read “}q \text{ and } \tfrac{r}{b}\text{”)}, \qquad \text{for example } \frac{17}{5} = 3\frac{2}{5}.$$

$q\frac{r}{b}$ is a **mixed number**: a *whole part* q and a *fraction part* $\frac{r}{b}$ (less than 1). Conversely, $q\frac{r}{b} = \frac{q \times b + r}{b}$.

③ Properties of the operations – clever calculation

For fractions (or mixed numbers) $A,\ B,\ C$:

Commutative: $A + B = B + A$; $A \times B = B \times A$

Associative: $(A + B) + C = A + (B + C)$

Subtracting a sum: $A - (B + C) = A - B - C$

Distributive: $A \times (B \pm C) = A \times B \pm A \times C$

Subtracting a difference: $A - (B - C) = A - B + C$

Dividing by a product: $A : (B \times C) = A : B : C$

To calculate quickly, *group terms whose sum (or difference) is a whole number*, or *take out a common factor*.

④ Patterned sums of fractions

- **Splitting a fraction into a difference:** for $b > a$,

$$\frac{b-a}{a \times b} = \frac{1}{a} - \frac{1}{b}, \qquad \text{for example} \quad \frac{1}{2 \times 3} = \frac{1}{2} - \frac{1}{3}; \quad \frac{3}{4 \times 7} = \frac{1}{4} - \frac{1}{7}.$$

  When such fractions are added, the middle terms *cancel out*, leaving only the first and the last.

- **Sums with a constant ratio** (each term is the previous one times the same number), e.g. $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots$: multiply the sum by that number and subtract the original sum.

Example 1

Calculate in the most convenient way:

$$A = \frac{3}{5} + 2\frac{1}{4} + \frac{2}{5} + \frac{3}{4} \qquad B = 4\frac{2}{7} - \left(1\frac{3}{8} + \frac{2}{7}\right) \qquad C = \frac{7}{4} \times 3\frac{1}{3} - \frac{7}{4} \times 1\frac{1}{3}$$

Guided solution.

A) Group terms with whole-number sums: $A = \left(\frac{3}{5} + \frac{2}{5}\right) + \left(2\frac{1}{4} + \frac{3}{4}\right) = 1 + 3 = 4.$

B) Subtracting a sum: $B = 4\frac{2}{7} - \frac{2}{7} - 1\frac{3}{8} = 4 - 1\frac{3}{8} = 2\frac{5}{8}.$

C) Take out the common factor: $C = \frac{7}{4} \times \left(3\frac{1}{3} - 1\frac{1}{3}\right) = \frac{7}{4} \times 2 = \frac{7}{2}.$

Example 2

Calculate:

$$A = \frac{1}{1\times 2} + \frac{1}{2\times 3} + \frac{1}{3\times 4} + \cdots + \frac{1}{9\times 10} \qquad B = \frac{1}{6} + \frac{1}{12} + \frac{1}{20} + \cdots + \frac{1}{110}$$

Guided solution.

A) Split each fraction: $\frac{1}{1\times 2} = \frac{1}{1} - \frac{1}{2}$, $\frac{1}{2\times 3} = \frac{1}{2} - \frac{1}{3}$, $\cdots$

$$A = 1 - \frac{1}{2} + \frac{1}{2} - \frac{1}{3} + \cdots + \frac{1}{9} - \frac{1}{10} = 1 - \frac{1}{10} = \frac{9}{10}.$$

B) Notice: $6 = 2\times 3$, $12 = 3\times 4$, $20 = 4\times 5, \ldots, 110 = 10\times 11$.

Hence

$$B = \frac{1}{2} - \frac{1}{3} + \frac{1}{3} - \frac{1}{4} + \cdots + \frac{1}{10} - \frac{1}{11} = \frac{1}{2} - \frac{1}{11} = \frac{9}{22}.$$

Example 3

Calculate $D = \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81} + \frac{1}{243}$.

Guided solution.

Each term is the previous one times $\frac{1}{3}$.

Multiply D by 3:

$$3\times D = 1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81}.$$

Subtracting, the common terms cancel: $3\times D - D = 1 - \frac{1}{243}$, so $2\times D = \frac{242}{243}$.

Therefore $D = \frac{242}{243} : 2 = \frac{121}{243}$.

Example 4

Calculate the product $P = \left(1 - \frac{1}{2}\right) \times \left(1 - \frac{1}{3}\right) \times \left(1 - \frac{1}{4}\right) \times \cdots \times \left(1 - \frac{1}{20}\right)$.

Guided solution.

Work out each factor, then cancel diagonally (each numerator cancels the previous denominator):

$$P = \frac{1}{2} \times \frac{2}{3} \times \frac{3}{4} \times \cdots \times \frac{19}{20} = \frac{1\times 2\times 3\times \cdots \times 19}{2\times 3\times 4\times \cdots \times 20} = \frac{1}{20}.$$

Practice

Problem 1

Simplify to lowest terms:

$$\frac{18}{24};\qquad \frac{45}{60};\qquad \frac{56}{98};\qquad \frac{125}{1\,000}.$$

Your work:

Problem 2

Fill in $<$, $>$, $=$ and explain:

a) $\frac{5}{8} \square \frac{7}{12}$ **b)** $\frac{17}{19} \square \frac{17}{23}$ **c)** $\frac{2\,024}{2\,025} \square \frac{2\,025}{2\,026}$

Your work:

Problem 3

Calculate:

$$A = \frac{7}{9} - \frac{4}{15} + \frac{1}{6} \qquad B = \frac{38}{15} - \left(\frac{2}{3} + \frac{8}{15}\right) \qquad C = \frac{16}{11} - \frac{5}{6} + \frac{6}{11} - \frac{1}{6}$$

Your work:

Problem 4

Calculate:

$A = 2\frac{3}{5} - 1\frac{1}{3} + 1\frac{7}{15}$ $B = 5\frac{1}{4} + 2\frac{5}{6} - 3\frac{1}{12}$ $C = 6\frac{2}{7} - \left(2\frac{1}{3} + 1\frac{2}{7}\right)$

Your work:

Problem 5

Calculate in the most convenient way:

$A = \frac{5}{7} \times \frac{3}{8} + \frac{5}{7} \times \frac{5}{8}$ $B = \frac{3}{4} \times \frac{12}{5} \times \frac{5}{9} \times \frac{4}{3}$

$C = \frac{7}{9} \times \frac{5}{6} - \frac{7}{9} \times \frac{1}{3}$ $D = 2\frac{1}{3} : 1\frac{1}{6}$

Your work:

Problem 6

Find y:

a) $y \times \frac{3}{5} = \frac{9}{10}$ **b)** $y + \frac{5}{6} = 2\frac{1}{4}$ **c)** $\frac{4}{7} : y = \frac{2}{3}$

d) $\left(y - \frac{1}{2}\right) \times \frac{4}{5} = \frac{2}{5}$ **e)** $y \times 1\frac{1}{4} + y \times \frac{3}{4} = 6$ **g)** $y : \frac{2}{3} + y : \frac{1}{3} = 18$

Your work:

Problem 7

Find the natural number y:

a) $\frac{y-1}{4} = \frac{15}{20}$

b) $\frac{8}{12} = \frac{10}{y+3}$

c) $\frac{1}{4} < \frac{2}{y} < \frac{1}{2}$

d) $\frac{3}{7} < \frac{y}{14} < \frac{5}{7}$

Your work:

Problem 8

A rectangular cloth is $\frac{7}{4}$ m long, and its width is $\frac{5}{12}$ m less than its length. Find its perimeter and area.

Problem 35 **

Calculate $M = \left(1 - \frac{1}{4}\right) \times \left(1 - \frac{1}{9}\right) \times \left(1 - \frac{1}{16}\right) \times \cdots \times \left(1 - \frac{1}{100}\right)$.

Your work:

Problem 36 ★★

Find the natural number y: $\frac{1}{5\times 6}+\frac{1}{6\times 7}+\frac{1}{7\times 8}+\cdots+\frac{1}{y\times(y+1)}=\frac{1}{10}$.

Your work:

Problem 37 ★★

Without adding, compare $S=\frac{1}{11}+\frac{1}{12}+\frac{1}{13}+\cdots+\frac{1}{20}$ with $\frac{1}{2}$.

Your work:

Problem 38 ★

Calculate: $\frac{1}{1\times 2}+\frac{1}{2\times 3}+\frac{1}{3\times 4}+\cdots+\frac{1}{99\times 100}$.

Your work:

Problem 39

Calculate: $\frac{2}{1\times 3}+\frac{2}{3\times 5}+\frac{2}{5\times 7}+\cdots+\frac{2}{19\times 21}$.

Your work:

Problem 40

Calculate: $\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+\cdots+\frac{1}{1\,024}$.

Your work:

Problem 41

Calculate: $\left(1+\frac{1}{2}\right)\times\left(1+\frac{1}{3}\right)\times\left(1+\frac{1}{4}\right)\times\cdots\times\left(1+\frac{1}{99}\right)$.

Your work:

Problem 42

Compare $\frac{13}{27}$ and $\frac{27}{55}$ without a common denominator.

Your work:

Problem 43

Write three different fractions greater than $\frac{1}{3}$ and less than $\frac{1}{2}$.

Your work:

Problem 44

Find every whole number x with $\frac{1}{3} < \frac{x}{12} < \frac{3}{4}$.

Your work:

Problem 45

Which whole number added to both the top and bottom of $\frac{5}{11}$ gives a fraction equal to $\frac{3}{5}$?

Your work:

Problem 46

Which whole number, taken from the top of $\frac{23}{37}$ and added to the bottom, gives a fraction equal to $\frac{1}{3}$?

Your work:

Problem 47

Calculate: $\frac{1}{3} + \frac{1}{15} + \frac{1}{35} + \frac{1}{63} + \frac{1}{99}$.

Your work:

Problem 48 *

Write $\frac{7}{12}$ as the sum of two different fractions with numerator 1.

Your work:

Problem 49 **

Calculate: $1 + \frac{1}{3} + \frac{1}{6} + \frac{1}{10} + \frac{1}{15} + \cdots + \frac{1}{45}$ (the denominators are $1,\ 3,\ 6,\ 10,\ 15,\ \ldots$).

Your work:

Problem 50 **

Find a fraction with denominator 13 such that adding 6 to its numerator (same denominator) makes it 3 times as large.

Your work:

3 Decimals

① Decimal fractions – Decimals

- A **decimal fraction** has denominator 10, 100, 1 000, ... For example $\frac{4}{10}$, $\frac{45}{100}$, $\frac{358}{1\,000}$.
- Every decimal fraction can be written as a **decimal**: $\frac{4}{10} = 0.4$; $\frac{45}{10} = 4.5$; $\frac{358}{1\,000} = 0.358$.
- Many other fractions can be changed into decimal fractions and then into decimals: $\frac{1}{2} = \frac{5}{10} = 0.5$; $\frac{13}{5} = \frac{26}{10} = 2.6$.
- A decimal has a **whole-number part** (left of the decimal point) and a **decimal part** (right of it). The decimal places are: tenths, hundredths, thousandths, ...
- One unit of any place equals 10 units of the next place to the right. Writing (or removing) zeros at the right end of the decimal part does not change the value: $2.5 = 2.50 = 2.500$.

② Comparing two decimals

- Compare the **whole-number parts** first: the larger whole part gives the larger number.
- If the whole parts are equal, compare the decimal places in turn (tenths, hundredths, thousandths, ...). At the first place where the digits differ, the larger digit gives the larger number.

Example: $7.305 > 7.29$ because the whole parts are equal and in the tenths $3 > 2$.

③ Moving the decimal point

- Moving the point 1, 2, 3, ... places to the **right** makes the number 10, 100, 1 000, ... **times larger**: $3.75 \times 10 = 37.5$.
- Moving the point 1, 2, 3, ... places to the **left** makes it 10, 100, 1 000, ... **times smaller**: $52.1 : 100 = 0.521$.
- So when the point moves one place left, if the new number is 1 part, the old number is 10 such parts: the number has *decreased* by 9 parts.

Example 1

Write these decimals:

a) 4 tens, 7 ones, 5 tenths, 3 **b)** 5 ones and 38 hundredths; **c)** 0 ones and 7 thousandths. thousandths;

Guided solution.

Put each digit in its place; write 0 in any empty place:

a) 47.503; **b)** 5.38; **c)** 0.007.

Example 2

Write as fractions in lowest terms: 12.25 and 3.125.

Guided solution.

Write as a decimal fraction, then simplify:

$$12.25 = \frac{1\,225}{100} = \frac{49}{4}; \qquad 3.125 = \frac{3\,125}{1\,000} = \frac{25}{8}.$$

Example 3

Find all natural numbers x with $2.46 < x < \frac{31}{5}$.

Guided solution.

Change $\frac{31}{5} = \frac{62}{10} = 6.2$.

We need $2.46 < x < 6.2$, so $x \in \{3;\ 4;\ 5;\ 6\}$.

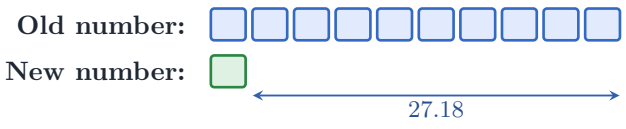

Example 4

When the decimal point of a number is moved one place to the left, the number decreases by 27.18. Find the number.

Guided solution.

Moving the point one place left makes the number 10 times smaller.

Bar model:

Difference in parts: $10 - 1 = 9$.

One part (the new number): $27.18 : 9 = 3.02$.

The number: $3.02 \times 10 = 30.2$.

Check: $30.2 - 3.02 = 27.18$.

Example 5

Calculate quickly: $S = 0.2 + 0.4 + 0.6 + \cdots + 3.8 + 4$.

Guided solution.

This is an arithmetic sequence with difference 0.2.

Number of terms: $(4 - 0.2) : 0.2 + 1 = 20$.

Sum: $S = (0.2 + 4) \times 20 : 2 = 42$.

Practice

Problem 1

Write as decimals:

a) $\frac{7}{10}$; $\frac{9}{1\,000}$; $\frac{63}{100}$; $\frac{1\,234}{100}$; $4\frac{3}{10}$; $12\frac{45}{1\,000}$ **b)** $\frac{2}{5}$; $\frac{7}{4}$; $3\frac{9}{20}$; $\frac{11}{8}$

Your work:

Problem 2

Write as decimal fractions: 0.27; 0.048; 3.6; 15.0091.

Your work:

Problem 3

Write the decimal made of:

a) 6 ones, 3 tenths, 4 hundredths, 1 thousandth;

b) 42 ones, 5 tenths, 9 thousandths;

c) 3 hundreds, 7 ones, 8 hundredths;

d) 0 ones and 6 hundredths.

Your work:

Problem 4

Order from smallest to largest: 5.34; 5.043; 5.4; 5.304; 4.99.

Your work:

Problem 5

Find the suitable digits:

a) $7.6\overline{x}2 < 7.612$

b) $3.4\overline{y}5 > 3.475$

c) $5.726 < 5.7\overline{a}7 < 5.755$

Your work:

Problem 6

Find all natural numbers n such that

a) $0.7 < n < 3.2$;

b) $46.85 < n < 50.1$.

Your work:

Problem 7

Find two consecutive natural numbers m and n such that

a) $m < 27.4 < n$; **b)** $m < 99.9 < n$.

Your work:

Problem 8

Find all decimals x with two decimal places such that $0.345 < x < 0.4$.

Your work:

Problem 9

Using the four digits 1, 3, 6, 8 once each, write the smallest and the largest decimals with two decimal places.

Your work:

Problem 10

Calculate in the most convenient way:

$A = 0.01 + 0.02 + 0.03 + \cdots + 0.09 + 0.10$ $B = 1.3 + 1.5 + 1.7 + \cdots + 19.9 + 20.1$

Your work:

Problem 11

Work out mentally:

3.75×10	0.068×100	$52.1 : 10$
$7.4 : 100$	$0.5 \times 1\,000$	$216 : 1\,000$

Your work:

Problem 12

Fill in the decimals:

a) 3 m 45 cm = ... m **b)** 2 kg 50 g = ... kg **c)** 4 km 25 m = ... km

d) 905 g = ... kg **e)** 38 dm^2 = ... m^2 **g)** 7 m^2 5 dm^2 = ... m^2

Your work:

Problem 13

The first rope is 3 m 15 cm long. The second is 8 dm longer than the first. The third is 65 cm shorter than the second. Find the total length of the three ropes in metres.

Your work:

Problem 14

Moving the decimal point of a number one place to the left makes it 16.74 smaller. Find the number.

Your work:

Problem 15

Moving the decimal point of a number one place to the right makes it 48.24 larger. Find the number.

Your work:

Problem 16

Write the decimal made of: **a)** five ones, four tenths, seven hundredths; **b)** zero ones, three thousandths; **c)** twelve ones, six hundredths.

Your work:

Problem 17

What is the value of the digit 7 in each number? **a)** 3.472; **b)** 70.25; **c)** 0.007.

Your work:

Problem 18

Write as decimals: $\frac{3}{10}$; $\frac{47}{100}$; $\frac{9}{1\,000}$; $1\frac{3}{4}$.

Your work:

Problem 19

Write as decimals (change the denominator to 10, 100 or 1 000): $\frac{3}{5}$; $\frac{7}{20}$; $\frac{9}{25}$; $\frac{3}{8}$.

Your work:

Problem 20

Fill in $>$, $<$, $=$: **a)** $4.7 \square 4.70$; **b)** $0.09 \square 0.1$; **c)** $12.305 \square 12.35$.

Your work:

Problem 21

Order from largest to smallest: 0.8, 0.08, 0.88, 0.808.

Your work:

Problem 22

Write as decimals: **a)** 5 m 7 cm = ... m; **b)** 450 g = ... kg; **c)** 3 quintals 5 kg = ... quintals (1 quintal = 100 kg); **d)** 2 km 30 m = ... km.

Your work:

Problem 23

Write as decimals: **a)** 3 m^2 25 dm^2 = ... m^2; **b)** 7 dm^2 5 cm^2 = ... dm^2; **c)** 4 500 m^2 = ... ha.

Your work:

Problem 24

Work out mentally: 3.75×10; 0.42×100; $56.3 : 10$; $7.8 : 100$.

Your work:

Problem 25

Calculate: **a)** $12.5 + 3.75$; **b)** $20 - 7.36$; **c)** $4.5 + 2.35 - 1.8$.

Your work:

Problem 26

Find x: **a)** $x + 2.75 = 6.1$; **b)** $x - 4.6 = 3.85$.

Your work:

Problem 27

Calculate cleverly: $3.25 + 4.8 + 6.75 + 5.2$.

Your work:

Problem 28

A shop sells sugar on three days: 12.5 kg on day one, 3.75 kg more on day two, and 2.4 kg less than day two on day three. How much sugar does it sell in all?

Your work:

Problem 29

Find every decimal x with one decimal place such that $3.4 < x < 3.9$.

Your work:

Problem 30

Write the largest and the smallest decimal with three different digits, two decimal places and a non-zero whole part.

Your work:

Challenge – Extension

Problem 31 ✷

Moving the decimal point of a number two places to the left makes it 40.887 smaller. Find the number.

Your work:

Problem 32 ✷

Two decimals add up to 151.5. Moving the decimal point of the first number two places left gives the second number. Find both numbers.

Your work:

Problem 33 ✷

A decimal, with its point moved one place to the right, is added to the original number; the result is 75.9. Find the number.

Your work:

Problem 34 *

Replace a, b with suitable digits: $\overline{1a.b} + \overline{a.b} = 20.8$.

Your work:

Problem 35 *

Consider the sequence $0.5,\ 1,\ 1.5,\ 2,\ \ldots,\ 49.5,\ 50$.

a) How many terms are there?

b) What is the 37th term?

c) Find the sum of all terms.

d) Find the sum of the first 40 terms.

Your work:

Problem 36 *

Using $0,\ 4,\ 6,\ 8$ once each, how many decimals can be written whose whole-number part and decimal part both have two digits?

Your work:

Problem 37 **

Find the smallest decimal with all digits different whose digit sum is 10.

Your work:

Problem 38 ⁕⁕

A decimal has two decimal places. Removing its decimal point gives a number 1 221.66 greater than the original. Find the decimal.

Your work:

Problem 39 ⁕

Moving the decimal point of a number two places to the right makes it 207.9 larger. Find the number.

Your work:

Problem 40 ⁕

Two decimals add up to 22.11. Moving the point of the smaller one place right gives the larger. Find them.

Your work:

Problem 41 ⁕

Two numbers differ by 49.5. Moving the point of the larger one place left gives the smaller. Find them.

Your work:

Problem 42 ⁕

Consider $0.1,\ 0.3,\ 0.5,\ \ldots,\ 9.9$. How many terms are there? Find their sum.

Your work:

Problem 43

How many decimals with two decimal places are greater than 2 and less than 3?

Your work:

Problem 44

Find every decimal x with one decimal place such that $5.15 < x < 5.52$.

Your work:

Problem 45

Calculate quickly: $1.2 + 2.3 + 3.4 + 4.5 + 5.6 + 6.7 + 7.8 + 8.9$.

Your work:

Problem 46

Find digits a and b with $\overline{a.b} + \overline{b.a} = 7.7$ and $a - b = 3$.

Your work:

Problem 47 *

Moving the point of a decimal one place right and then subtracting the original number gives 31.5. Find the number.

Your work:

Problem 48 *

Three decimals add up to 11.1. The first is 1.5 more than the second, which is 1.2 more than the third. Find them.

Your work:

Problem 49 **

Using 2, 5, 7 once each, write every decimal with one decimal place and add them up.

Your work:

Problem 50 **

Writing the block 142857 over and over after the point gives $0.142857142857\ldots$ What is the 100th digit after the point?

Your work:

4 Three Basic Fraction Problems

① The three basic problems

- **Problem 1 – A fraction of a number.** To find $\frac{m}{n}$ of A, compute $A \times \frac{m}{n}$ (or $A : n \times m$). Example: $\frac{2}{5}$ of 60 is $60 \times \frac{2}{5} = 24$.
- **Problem 2 – A number from the value of its fraction.** If $\frac{a}{b}$ of a number is X, the number is $X : \frac{a}{b}$ (or $X : a \times b$). Example: if $\frac{2}{5}$ of a number is 24, the number is $24 : \frac{2}{5} = 60$.
- **Problem 3 – The ratio of two numbers.** The ratio of a to b ($b \neq 0$) is $a : b$ or $\frac{a}{b}$, usually in lowest terms. Both quantities must be in *the same unit*. Example: the ratio of 45 to 20 is $\frac{45}{20} = \frac{9}{4}$.

② A fraction of what is left

When a problem says "$\frac{a}{b}$ *of what is left*", first find the remaining part (as a fraction of the whole), then take the fraction of it. For instance, using $\frac{1}{3}$ of a journey leaves $\frac{2}{3}$; going on for $\frac{3}{5}$ *of the rest* covers $\frac{3}{5} \times \frac{2}{3} = \frac{2}{5}$ of the journey.

A **bar model** shows clearly which part matches the known number.

Example 1

A garden has an area of 720 m^2. $\frac{3}{8}$ of it grows vegetables, $\frac{5}{12}$ grows flowers, and the rest is paths. Find the area of the paths.

Guided solution.

Way 1. Vegetables: $720 \times \frac{3}{8} = 270$ (m^2).

Flowers: $720 \times \frac{5}{12} = 300$ (m^2).

Paths: $720 - (270 + 300) = 150$ (m^2).

Way 2. The paths take $1 - \frac{3}{8} - \frac{5}{12} = \frac{24-9-10}{24} = \frac{5}{24}$ of the garden, i.e.

$720 \times \frac{5}{24} = 150$ (m^2).

Example 2

In the school chess club, $\frac{3}{5}$ of the members play chess, $\frac{1}{4}$ play Chinese chess, and the remaining 12 play tic-tac-toe. How many members does the club have?

Guided solution.

The 12 tic-tac-toe players are $1 - \frac{3}{5} - \frac{1}{4} = \frac{20-12-5}{20} = \frac{3}{20}$ of the members.

Number of members: $12 : \frac{3}{20} = 80$.

Example 3

A cyclist rides for three days. On day one she covers $\frac{1}{3}$ of the route, on day two $\frac{3}{5}$ of the remaining distance, and on day three the last 24 km. How long is the route?

Guided solution.

After day one, $1 - \frac{1}{3} = \frac{2}{3}$ of the route is left.

Day two covers $\frac{3}{5}$ of that, so day three covers $1 - \frac{3}{5} = \frac{2}{5}$ of the remainder, i.e.

$\frac{2}{5} \times \frac{2}{3} = \frac{4}{15}$ of the route.

The route is $24 : \frac{4}{15} = 90$ (km).

Example 4

Three numbers add up to 170. The first is $\frac{1}{2}$ of the second, and the second is $\frac{3}{4}$ of the third. Find the three numbers.

Guided solution.

Use a common "part": the second number is 2 parts compared with the first and 3 parts compared with the third.

Take it as 6 parts:

$$\text{first} = 3 \text{ parts}; \quad \text{second} = 6 \text{ parts}; \quad \text{third} = 8 \text{ parts}.$$

Total: $3 + 6 + 8 = 17$ parts; one part is $170 : 17 = 10$.
The numbers are $30,\ 60,\ 80$.

Example 5

A number plus 45 equals $\frac{8}{5}$ of the number. Find the number.

Guided solution.

The number is $\frac{5}{5}$ of itself; adding 45 makes it $\frac{8}{5}$.

So 45 is $\frac{8}{5} - \frac{5}{5} = \frac{3}{5}$ of the number.

The number is $45 : \frac{3}{5} = 75$.

Practice

Problem 1

A farm keeps 240 birds: chickens, ducks and geese. Chickens are $\frac{3}{8}$ of all the birds and ducks are $\frac{1}{3}$. How many geese are there?

Your work:

Problem 2

A school has 1 200 pupils. Grade 5 makes up $\frac{1}{5}$ of them, and girls are $\frac{7}{12}$ of Grade 5. How many boys and how many girls are in Grade 5?

Your work:

Problem 3

A runner covers 30 km in three hours. In the first hour he runs $\frac{2}{5}$ of the distance, in the second hour $\frac{1}{2}$ of the remaining distance. How far does he run in the third hour?

Your work:

Problem 4

Mum buys 12 kg of rice. First she uses $\frac{1}{3}$ of it plus 1 kg more. Next she uses $\frac{1}{2}$ of what is left plus $\frac{1}{2}$ kg more. How much rice is left?

Your work:

Problem 5

$\frac{2}{3}$ of the pupils in class 5B is 22 pupils. How many pupils are in class 5B?

Your work:

Problem 6

After 18 litres are taken from a can of oil, $\frac{5}{8}$ of the original amount is left. How much oil was there at first?

Your work:

Problem 7

A number minus 28 equals $\frac{3}{5}$ of the number. Find the number.

Your work:

Problem 8

This season a field's rice harvest grew by $\frac{1}{4}$ compared with last season, reaching 15 tonnes. How much was harvested last season?

Your work:

Problem 9

After selling $\frac{3}{7}$ of its boxes of cakes plus 4 more boxes, a shop has 28 boxes left. How many boxes did it have at first?

Your work:

Problem 10

A racing cyclist covers $\frac{4}{15}$ of a route on day one, $\frac{2}{5}$ of the route on day two, and the last 100 km on day three. How long is the route?

Your work:

Problem 11

Two barns hold equal amounts of rice. Taking $\frac{2}{5}$ from the first barn and $\frac{3}{10}$ from the second leaves the first with 12 tonnes less than the second. How much did each barn hold at first?

Your work:

Problem 12

Nam has some marbles. Blue ones are $\frac{1}{3}$ of all, yellow ones are $\frac{3}{4}$ of the blue ones, and the other 30 are red. How many marbles does Nam have?

Your work:

Problem 13

The first customer buys $\frac{1}{6}$ of the potatoes, the second buys $\frac{3}{5}$ of the rest, and the seller has 18 kg left. How much did each customer buy?

Your work:

Problem 14

Find the ratio of:

a) 45 to 20; **b)** 1.2 to 3.6; **c)** $\frac{2}{3}$ m to 75 cm.

Your work:

Problem 15

Find $\frac{3}{4}$ of 56 kg.

Your work:

Problem 16

How many minutes are $\frac{2}{5}$ of an hour?

Your work:

Problem 17

Class 5C has 40 pupils, and $\frac{3}{8}$ of them earn top marks. How many is that?

Your work:

Problem 18

A roll of cloth is 24 m long. The shop sells $\frac{5}{8}$ of it. How many metres are left?

Your work:

Problem 19

Mr Tu's trip to town is 72 km. He has covered $\frac{4}{9}$ of it. How far is left?

Your work:

Problem 20

$\frac{3}{7}$ of Hung's money is 42 000 dong. How much does he have?

Your work:

Problem 21

Find a number given that $\frac{5}{6}$ of it is 35.

Your work:

Problem 22

An has read $\frac{2}{5}$ of a book and has 90 pages still to read. How many pages does the book have?

Your work:

Problem 23

Find the ratio of: **a)** 15 to 25; **b)** 2 hours to 40 minutes; **c)** 1.2 m to 30 cm.

Your work:

Problem 24

Class 5D has 32 pupils, 14 of them girls. Find the ratio of girls to boys, and of girls to the whole class.

Your work:

Problem 25

A shop has 360 kg of rice. On day one it sells $\frac{1}{4}$ of it; on day two, $\frac{2}{5}$ of what is left. How much rice remains?

Your work:

Problem 26

Mai has 450 000 dong. She spends $\frac{2}{9}$ of it on books and $\frac{1}{3}$ of it on notebooks. How much is left?

Your work:

Problem 27

After $\frac{3}{8}$ of the water in a tank is used, 750 litres remain. How much water was there at first?

Your work:

Problem 28

A number plus $\frac{1}{4}$ of itself is 60. Find the number.

Your work:

Problem 29

A number minus $\frac{2}{7}$ of itself is 35. Find the number.

Your work:

Problem 30

An, Binh and Cuong have 84 marbles. An has $\frac{1}{3}$ of them and Binh $\frac{3}{7}$ of them. How many does each have?

Your work:

Challenge – Extension

Problem 31 ★

Classes 5A and 5B have 68 pupils in total, and $\frac{3}{4}$ of class 5A equals $\frac{2}{3}$ of class 5B. How many pupils are in each class?

Your work:

Problem 32 *

In a music group, the number of boys is $\frac{2}{3}$ of the number of girls. After 3 more boys join, the boys are $\frac{5}{6}$ of the girls. How many boys and girls were there at first?

Your work:

Problem 33 *

Mr An and Mrs Ha go to the market with 3 000 000 VND in total. Mr An spends $\frac{5}{9}$ of his money and Mrs Ha spends $\frac{3}{4}$ of hers; then they have equal amounts left. How much did each bring?

Your work:

Problem 34 **

Three teams plant trees. Team One plants $\frac{1}{3}$ of all the trees, Team Two plants $\frac{2}{5}$ of the rest, and Team Three plants 30 trees more than Team Two. How many trees are planted in all?

Your work:

Problem 35 ★★

A shop sells all its oranges in 4 days. Day one sells $\frac{1}{3}$ of what the next three days sell together. Day two sells $\frac{2}{3}$ of day one. Day three sells half of day four. Day four sells 15 kg more than day one. How many kilograms of oranges were there at first?

Your work:

Problem 36 ★

Mum shares sweets: An gets $\frac{1}{3}$ of them, Binh gets $\frac{1}{4}$, and the remaining 15 go to little Hoa. How many sweets were there?

Your work:

Problem 37

A seller sells $\frac{2}{5}$ of her oranges, then $\frac{1}{3}$ of the rest, then the last 24. How many oranges did she have?

Your work:

Problem 38

Two classes have 76 pupils. $\frac{3}{5}$ of class A equals $\frac{2}{3}$ of class B. How many pupils are in each class?

Your work:

Problem 39

A walker covers $\frac{1}{4}$ of a route on day one, $\frac{2}{3}$ of the rest on day two and the last 15 km on day three. How long is the route?

Problem 50 ★★

An egg seller sells $\frac{2}{5}$ of the eggs in the morning and $\frac{3}{4}$ of the rest in the afternoon, with 30 left at the end. How many eggs were there?

Your work:

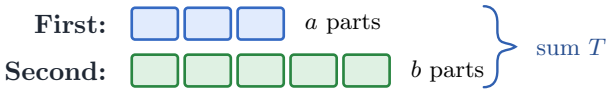

5 Sum–Ratio and Difference–Ratio Problems

① The ratio of two numbers

- The ratio of a to b is $a : b$ or $\frac{a}{b}$ ($b \neq 0$; a and b in the same unit), usually in lowest terms.
- A ratio may be given as a decimal or as "times": $0.75 = \frac{3}{4}$; $1.5 = \frac{3}{2}$; "a is 3 times b" means $\frac{a}{b} = \frac{3}{1}$.
- "$\frac{1}{3}$ of the first number equals $\frac{1}{6}$ of the second" means the first is 3 equal parts and the second 6 such parts: the ratio is $\frac{3}{6} = \frac{1}{2}$.

② Two problem types, solved with bar models

Sum–ratio: find two numbers given their sum T and their ratio $\frac{a}{b}$.

Step 1: total number of equal parts $a + b$. Step 2: one part $= T : (a + b)$. Step 3: first number = one part $\times a$; second number = $T -$ first.

Difference–ratio: find two numbers given their difference H and ratio $\frac{a}{b}$ ($a > b$). Work the same way, but H matches the *difference in parts* $a - b$; one part is $H : (a - b)$.

Note: draw equal parts with equal lengths, and read carefully to see *whether the sum or the difference stays the same* when the numbers change (for instance, the age gap between two people never changes).

Example 1

A rectangular stadium has perimeter 400 m, and its width is $\frac{3}{5}$ of its length. Find its area.

Guided solution.

Half the perimeter (length + width): $400 : 2 = 200$ (m).

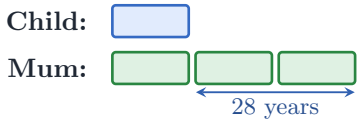

Total parts: $3 + 5 = 8$; one part: $200 : 8 = 25$ (m).
Width: $25 \times 3 = 75$ (m); length: $200 - 75 = 125$ (m).
Area: $125 \times 75 = 9\,375$ (m^2).

Example 2

Mum is 28 years older than her child. In 4 years she will be 3 times as old as the child. How old is each of them now?

Guided solution.

The age gap never changes; in 4 years Mum is still 28 years older.
Ages in 4 years:

Difference in parts: $3 - 1 = 2$.
The child's age in 4 years: $28 : 2 = 14$.
The child now: $14 - 4 = 10$; Mum now: $10 + 28 = 38$.

Example 3

The average of two natural numbers is 135, and $\frac{1}{3}$ of the first equals $\frac{1}{6}$ of the second. Find the two numbers.

Guided solution.

Sum: $135 \times 2 = 270$.
As $\frac{1}{3}$ of the first equals $\frac{1}{6}$ of the second, the first is 3 parts and the second 6 such parts.
Total parts: $3 + 6 = 9$; one part: $270 : 9 = 30$.
First: $30 \times 3 = 90$; second: $270 - 90 = 180$.

Example 4

Two numbers add up to 84. The second is 0.75 of the first. Find them.

Guided solution.

Change $0.75 = \frac{3}{4}$: the second is 3 parts, the first 4 parts; 7 parts in all; one part: $84 : 7 = 12$.
First: $12 \times 4 = 48$; second: $84 - 48 = 36$.

Example 5

Find two numbers whose difference is 24 and whose ratio (smaller to larger) is 0.7.

Guided solution.

$0.7 = \frac{7}{10}$: smaller 7 parts, larger 10 parts; difference 3 parts $= 24$, so one part is 8.
Smaller: $8 \times 7 = 56$; larger: $56 + 24 = 80$.

Practice

Problem 1

The average of two numbers is 168, and their ratio is $\frac{5}{9}$. Find them.

Your work:

Problem 2

Find two numbers with sum 252 such that 8 times the smaller is the larger.

Your work:

Problem 3

In an exact division, the dividend plus the divisor is 342 and the quotient is 8. Find the dividend and the divisor.

Your work:

Problem 4

Two numbers add up to 286. Writing 0 on the right of the first number gives the second. Find them.

Your work:

Problem 5

Barn A holds 180 tonnes of rice more than barn B. If barn B receives 30 more tonnes, then barn A holds $\frac{6}{5}$ of barn B. How much did each barn hold at first?

Your work:

Problem 6

Mum and her child are 46 years old in total. In 4 years the child's age will be $\frac{2}{7}$ of Mum's. How old is each now?

Your work:

Problem 7

What natural number must be added to both the numerator and the denominator of $\frac{13}{29}$ to get a fraction equal to $\frac{3}{5}$?

Your work:

Problem 8

Subtract a natural number from the numerator of $\frac{11}{25}$ and add the same number to its denominator, to get a fraction equal to $\frac{1}{5}$. Find the number.

Your work:

Problem 9

Two sacks hold 160 kg of rice together. Moving 6 kg from the first sack to the second makes the first $\frac{3}{5}$ of the second. How much was in each sack at first?

Your work:

Problem 10

A rectangle has perimeter 180 cm. Adding 6 cm to its length and taking 6 cm off its width gives a rectangle whose length is twice its width. Find the area of the original rectangle.

Your work:

Problem 11

Grade 5 of a school has 315 pupils, and $\frac{1}{4}$ of the girls equals $\frac{1}{5}$ of the boys. How many girls and boys are there?

Your work:

Problem 12

Find two numbers whose difference is the largest two-digit number and whose ratio is $\frac{4}{7}$.

Your work:

Problem 13

Dad is 32 years older than his son. This year Dad is 5 times as old as the son. How old is the son?

Your work:

Problem 14

Find two numbers whose difference is 516, given that the larger divided by the smaller gives quotient 7 and remainder 12.

Your work:

Problem 15

Find a number such that deleting the 0 at its right end makes it 1 845 smaller.

Your work:

Problem 16

The difference of two numbers is $\frac{1}{4}$ of the smaller number. Their sum is 162. Find them.

Your work:

Problem 17

Find two numbers with sum 12.4, the first being $\frac{2}{3}$ of the second.

Your work:

Problem 18

Grade 5 has 288 pupils. The ratio of girls to boys is 0.6. How many girls and boys are there?

Your work:

Problem 19

A rectangular plot has perimeter 168 m; its length is 1.8 times its width. Find its area.

Your work:

Problem 20

Two numbers add up to 150 and are in the ratio $\frac{2}{3}$. Find them.

Your work:

Problem 21

Two numbers differ by 45 and are in the ratio $\frac{3}{8}$. Find them.

Your work:

Problem 22

Two tanks hold 120 litres; the first holds $\frac{3}{5}$ as much as the second. How much does each hold?

Your work:

Problem 23

A rectangular garden has perimeter 96 m, and its width is $\frac{1}{3}$ of its length. Find its area.

Your work:

Problem 24

This year a child's age is $\frac{2}{7}$ of the mother's, and she is 25 years older. Find both ages.

Your work:

Problem 25

The larger number is 5 times the smaller, and they differ by 72. Find them.

Your work:

Problem 26

Two numbers add up to 7.2; the first is 3 times the second. Find them.

Your work:

Problem 27

Class 5E has 35 pupils, with boys to girls in the ratio $\frac{3}{4}$. How many boys and girls are there?

Your work:

Problem 28

Two numbers have average 60; the smaller is $\frac{1}{4}$ of the larger. Find them.

Your work:

Problem 29

Two numbers differ by 30; the larger is 2.5 times the smaller. Find them.

Your work:

Problem 30

A rectangular garden is 15 m longer than it is wide, and its width is $\frac{2}{5}$ of its length. Find its area.

Your work:

Challenge – Extension

Problem 31 *

Two cans hold 160.5 litres of oil. After 9.5 litres are poured from the first can into the second, the second holds 1.5 times as much as the first. How much did each can hold at first?

Your work:

Problem 32 *

The first sack has 20.4 kg more rice than the second. If 1.8 kg is added to each sack, the first will hold 3 times as much as the second. How much did each hold at first?

Your work:

Problem 33 *

The son's age is $\frac{1}{4}$ of his dad's. In 10 years it will be 0.4 of his dad's. How old is each now?

Your work:

Problem 34 **

In spring tree planting, Grade 4 plants $\frac{3}{5}$ as many trees as Grade 5. If each grade planted 20 more, Grade 4 would have $\frac{2}{3}$ as many as Grade 5. How many trees did each grade plant?

Your work:

Problem 35 **

The ratio of books on the top shelf to the bottom shelf is 0.5. Moving 9 books from the bottom to the top makes the ratio 0.8. How many books were on each shelf at first?

Your work:

Problem 36

Three numbers add up to 210. The first is $\frac{1}{2}$ of the second, and the third is twice the second. Find them.

Your work:

Problem 37

Two numbers add up to 357. Crossing out the units digit 5 of the larger gives the smaller. Find them.

Your work:

Problem 38

Two numbers differ by 33.3. Moving the point of the smaller one place right gives the larger. Find them.

Your work:

Two numbers differ by 87. Dividing the larger by the smaller gives 3 remainder 5. Find them.

Your work:

Problem 45 ⁎

A fraction's numerator and denominator add up to 120. Moving 10 from the denominator to the numerator gives a fraction equal to 1. Find it.

Your work:

Problem 46 ⁎

Adding 5 m to the width of a rectangle makes it a square and adds 60 m^2. Find the rectangle's area.

Your work:

Problem 47 ⁎⁎

A mother is 36 and her child 8. In how many years will she be 3 times as old?

Your work:

Problem 48 ★★

In an exact division the dividend, divisor and quotient add up to 195, and the quotient is 6. Find the dividend and divisor.

Your work:

Problem 49 ★★

A shop's sticky rice is $\frac{2}{5}$ of its plain rice. After 30 kg of plain rice is sold, the sticky rice is $\frac{1}{2}$ of the plain rice left. How much of each was there?

Your work:

Problem 50 ★★

Two whole numbers add up to 1 001. The larger ends in 0, and crossing out that 0 gives the smaller. Find them.

Your work:

6 (*) Problems with Two Ratios

① Look for the quantity that does not change

In many problems two numbers change and so does their ratio (the problem gives *two ratios*: before and after). The key is to find a quantity that **does not change** and use it as the "unit" of comparison:

- The **sum is constant** when an amount moves from one number to the other. Write each number as a *fraction of the sum*.
- The **difference is constant** when the same amount is added to (or taken from) both; age gaps are an example. Write each number as a *fraction of the difference*.
- **One number is constant** when only the other changes. Compare everything with the unchanged number.

The known change then matches the *difference of two fractions*, which gives the unchanged quantity.

Example 1

Find two numbers in the ratio $\frac{3}{7}$ such that adding 6 to the first and taking 6 from the second gives two numbers in the ratio $\frac{2}{3}$.

Guided solution.

Whatever is added to one is taken from the other, so **the sum is constant**.

At first the first number is $\frac{3}{3+7} = \frac{3}{10}$ of the sum; afterwards $\frac{2}{2+3} = \frac{2}{5} = \frac{4}{10}$ of the sum.

The first number grows by 6, which is $\frac{4}{10} - \frac{3}{10} = \frac{1}{10}$ of the sum.

Sum: $6 : \frac{1}{10} = 60$.

First: $60 \times \frac{3}{10} = 18$; second: $60 - 18 = 42$. (*Check:* $24 : 36 = \frac{2}{3}$.)

Example 2

The first number is $\frac{3}{8}$ of the second. Taking 5 from each makes the second 3 times the first. Find the numbers.

Guided solution.

The same amount is taken from both, so **the difference is constant**.

At first: first 3 parts, second 8 parts, difference 5 parts; the first is $\frac{3}{5}$ of the difference.

Afterwards: first 1 part, second 3 parts, difference 2 parts; the first is $\frac{1}{2}$ of the difference.

The 5 is $\frac{3}{5} - \frac{1}{2} = \frac{1}{10}$ of the difference.

Difference: $5 : \frac{1}{10} = 50$.

First: $50 \times \frac{3}{5} = 30$; second: 80.

Example 3

On a bus there are 3 times as many men as women. At the first stop 3 men get on and 3 women get off; now there are 5 times as many men as women. How many men and women were there at first?

Guided solution.

3 get on and 3 get off, so **the total is constant**.

Women were $\frac{1}{1+3} = \frac{1}{4}$ of the total, and later $\frac{1}{1+5} = \frac{1}{6}$.

The 3 women who left are $\frac{1}{4} - \frac{1}{6} = \frac{1}{12}$ of the total.

Total: $3 : \frac{1}{12} = 36$.

At first: 9 women and 27 men.

Example 4

If Nam gives Giang 3 sweets, Nam will have 2 times as many as Giang. If instead Giang gives Nam 3 sweets, Nam will have 5 times as many. How many sweets does each have?

Guided solution.

Giving sweets keeps **the total T constant**.

– Case 1: after giving, Nam has $\frac{2}{2+1} = \frac{2}{3}T$; so Nam has $\frac{2}{3}T + 3$.

– Case 2: after receiving, Nam has $\frac{5}{5+1} = \frac{5}{6}T$; so Nam has $\frac{5}{6}T - 3$.

Comparing: $\frac{5}{6}T - \frac{2}{3}T = 3 + 3$, i.e.

$\frac{1}{6}T = 6$ and $T = 36$.

Nam has $\frac{2}{3} \times 36 + 3 = 27$; Giang has $36 - 27 = 9$.

Practice

Problem 1

Find two numbers in the ratio $\frac{2}{3}$ such that adding 4 to the first and taking 4 from the second gives the ratio $\frac{3}{2}$.

Your work:

Problem 2

A fraction equals $\frac{2}{5}$. Adding 9 to its numerator and taking 9 from its denominator gives a fraction equal to $\frac{5}{2}$. Find the original fraction.

Your work:

Problem 3

The ratio of books on shelf I to shelf II is $\frac{5}{7}$. Moving 10 books from shelf I to shelf II makes shelf II hold 3 times as many as shelf I. How many books were on each shelf at first?

Your work:

Problem 4

Class 5A has twice as many boys as girls. If 3 girls join and 3 boys leave, the girls make up $\frac{5}{12}$ of the class. How many pupils are in class 5A?

Your work:

Problem 5

The first number is $\frac{2}{7}$ of the second. Adding 12 to each makes the first $\frac{1}{2}$ of the second. Find the numbers.

Your work:

Problem 6

This year the son's age is $\frac{1}{3}$ of the age gap between him and his dad. Six years ago it was $\frac{1}{5}$ of the gap. How much older is the dad?

Your work:

Problem 7

The masses of corn in two sacks are in the ratio $\frac{3}{8}$. Adding 4 kg to each makes the ratio $\frac{2}{5}$. How much corn was in each sack at first?

Your work:

Problem 8

Mum is now 5 times as old as her child. In six years she will be 3 times as old. How old is each now?

Your work:

Problem 9

A fraction equals $\frac{3}{4}$. Taking 6 from both its numerator and denominator gives a fraction equal to $\frac{5}{7}$. Find the original fraction.

Your work:

Problem 10

In class 5A the boys are $\frac{3}{4}$ of the girls. If 3 boys and 3 girls leave, the boys make up $\frac{5}{12}$ of the class. How many pupils were there at first?

Your work:

Problem 11

There are two barns. If 3 tonnes are added to barn A and 3 tonnes removed from barn B, the ratio of rice is $\frac{3}{7}$. If instead 5 tonnes are removed from A and 5 added to B, the ratio is $\frac{1}{4}$. How much does each barn hold?

Your work:

Problem 12

A fraction equals $\frac{5}{8}$. Adding 6 to both its numerator and denominator gives a fraction equal to $\frac{2}{3}$.

Find the original fraction.

Your work:

Problem 13

Two numbers are in the ratio $\frac{1}{2}$. Taking 5 from the second and adding it to the first gives the ratio $\frac{4}{5}$. Find them.

Your work:

Problem 14

Drum I holds $\frac{3}{5}$ as much oil as drum II. Pouring 6 litres from II into I makes them equal. How much does each hold?

Your work:

Problem 15

A fraction equals $\frac{3}{7}$. Moving 4 from the denominator to the numerator gives a fraction equal to 1. Find it.

Your work:

Problem 16

Barns I and II hold paddy in the ratio $\frac{7}{9}$. Moving 10 tonnes from I to II gives the ratio $\frac{3}{5}$. How much did each hold?

Your work:

Problem 17

A fraction equals $\frac{4}{5}$. Taking 6 from the numerator and adding 6 to the denominator gives $\frac{1}{2}$. Find it.

Your work:

Problem 18

The first number is $\frac{2}{5}$ of the second. Adding 9 to each makes the first $\frac{1}{2}$ of the second. Find them.

Your work:

Problem 19

Two numbers are in the ratio $\frac{3}{4}$. Taking 10 from each gives the ratio $\frac{1}{2}$. Find them.

Your work:

Problem 20

A child is $\frac{1}{4}$ of the mother's age now and will be $\frac{2}{5}$ of it in 8 years. Find both ages now.

Your work:

Problem 21

Four years ago the elder brother was 3 times as old as the younger; now he is 2 times as old. Find both ages now.

Your work:

Problem 22

A fraction equals $\frac{2}{3}$. Adding 5 to its top and bottom gives $\frac{3}{4}$. Find it.

Your work:

Problem 23

A fraction equals $\frac{5}{7}$. Taking 3 from its top and bottom gives $\frac{2}{3}$. Find it.

Your work:

Problem 24

Mr Ba's hens are $\frac{3}{5}$ as many as his ducks. After buying 12 more hens, the hens are $\frac{9}{10}$ as many as the ducks. How many of each did he have?

Your work:

Problem 25

The top shelf holds $\frac{4}{7}$ as many books as the bottom shelf. Adding 15 books to the top makes them equal. How many were on each?

Your work:

Problem 26

A fraction equals $\frac{3}{4}$. Keeping the numerator and adding 6 to the denominator gives $\frac{3}{5}$. Find it.

Your work:

Problem 27

On a coach the women are $\frac{2}{3}$ as many as the men. At a stop 4 men get off and 4 women get on, and then there are equal numbers. How many men and women were there at first?

Your work:

Problem 28

An has $\frac{5}{7}$ as many marbles as Binh. If Binh gives An 4, they have the same. How many does each have?

Your work:

Problem 29

A father is 4 times as old as his son now and will be 2 times as old in 20 years. Find both ages now.

Your work:

Problem 30

A shop has sugar equal to $\frac{3}{8}$ of its rice. After selling 40 kg of rice, the sugar is $\frac{1}{2}$ of the rice left. How much of each was there?

Your work:

Challenge – Extension

Problem 31 *

Three years ago a dad was 7 times as old as his son. In five years he will be 3 times as old. How old is each now?

Your work:

Problem 32 *

If An gives Binh 5 marbles they will have the same number. If Binh gives An 5 marbles, An will have 3 times as many as Binh. How many marbles does each have?

Your work:

Problem 33 *

The top shelf holds $\frac{2}{5}$ as many books as the bottom shelf. Moving 6 books from the bottom to the top makes the top hold $\frac{1}{2}$ as many as the bottom. How many books are there in all?

Your work:

Problem 34 ★★

Adding 3 to the numerator of a fraction gives a fraction equal to 1. Adding 3 to its denominator instead gives a fraction equal to $\frac{1}{2}$. Find the fraction.

Your work:

Problem 35 ★★

A shop has 4 times as much plain rice as sticky rice. After selling 30 kg of plain rice and 5 kg of sticky rice, the plain rice left is 3 times the sticky rice left. How much of each was there at first?

Your work:

Problem 36 ★

If An gives Binh 6 marbles, Binh has twice as many as An. If Binh gives An 6, they have the same. How many does each have?

Your work:

Problem 37 *

A mother is 4 times as old as her child now; five years ago she was 7 times as old. Find both ages now.

Your work:

Problem 38 *

In class 5G the boys are $\frac{5}{6}$ as many as the girls. If 3 boys leave, the boys are $\frac{3}{4}$ as many as the girls. How many boys and girls were there?

Your work:

Problem 39 *

A fraction equals $\frac{3}{8}$ and its denominator is 10 more than its numerator. Adding the same whole number to top and bottom gives $\frac{1}{2}$. Find the fraction and the number added.

Your work:

Problem 40 *

In class 5H the top pupils are $\frac{1}{4}$ as many as the rest. By the end of the year 3 more reach the top level, and the top pupils are $\frac{2}{5}$ as many as the rest. How many pupils are in the class?

Your work:

Problem 41 *

The younger brother is $\frac{2}{3}$ of the elder's age now and was $\frac{1}{2}$ of it five years ago. Find both ages now.

Your work:

Problem 42 *

Two tanks hold water in the ratio $\frac{2}{3}$. After 40 litres are used from each, the ratio is $\frac{1}{2}$. How much did each hold?

Your work:

Problem 43 *

Classes 5A and 5B are in the ratio $\frac{7}{8}$. Moving 3 pupils from 5B to 5A makes 5A 3 larger than 5B. How many pupils are in each class?

Your work:

Problem 44 *

An has $\frac{3}{5}$ as many marbles as Binh. An buys 8 more and Binh gives 8 away; then they have the same. How many did each have?

Your work:

Problem 45 *

Barn A holds 3 times as much paddy as barn B. If B takes in 30 more tonnes, A holds $\frac{3}{2}$ as much as B. How much did each hold?

Your work:

Problem 46 ★★

A father is 3 times as old as his son now and was 5 times as old ten years ago. How old was he when his son was born?

Your work:

Problem 47 ★★

Adding 2 to the numerator of a fraction gives $\frac{1}{2}$; taking 2 from the numerator gives $\frac{1}{4}$ (same denominator). Find the fraction.

Your work:

Problem 48 ★★

If An gives Binh 4 sweets, An has 3 times as many as Binh. If Binh gives An 4, An has 7 times as many. How many does each have?

Your work:

Problem 49 ★★

Find a fraction such that adding 1 to top and bottom gives $\frac{1}{2}$, and taking 1 from top and bottom gives $\frac{1}{3}$.

Your work:

Problem 50 ★★

This year An is $\frac{1}{3}$ of his father's age. In three years their ages will total 54. How old is each now?

Your work:

7 Direct and Inverse Proportion

① Two proportional quantities

Direct proportion. Two quantities are directly proportional if, when one is multiplied (or divided) by some number, the other is multiplied (or divided) by the same number. *Example:* metres of cloth and its cost (at a fixed price).

Inverse proportion. Two quantities are inversely proportional if, when one is multiplied by some number, the other is divided by that number; their *product* stays the same. *Example:* the number of workers and the number of days needed for the same job.

Two common methods:

- **The unitary method:** find the value for 1 unit (1 metre, 1 worker, 1 day,...), then multiply or divide.
- **The ratio method:** find how many times the first quantity grows (or shrinks), then change the second one accordingly.

For "workers – days" problems, think of the job as *(workers)* × *(days)* "worker-days"; the number of worker-days needed does not change.

Example 1

5 m of cloth cost 450 000 dong. How much do 15 m of the same cloth cost?

Guided solution.

Method 1 (unitary). 1 m costs $450\,000 : 5 = 90\,000$ dong, so 15 m cost $90\,000 \times 15 = 1\,350\,000$ dong.

Method 2 (ratio). 15 m is $15 : 5 = 3$ times 5 m, so the cost is 3 times as much: $450\,000 \times 3 = 1\,350\,000$ dong.

Answer: 1 350 000 dong.

Example 2

A team of 12 workers builds a stretch of road in 10 days. How many workers are needed to finish it in 8 days? (Everyone works at the same rate.)

Guided solution.

Workers and days are inversely proportional.

One worker alone would need $10 \times 12 = 120$ days, so the job takes 120 worker-days.

To finish in 8 days we need $120 : 8 = 15$ workers.

Answer: 15 workers.

Example 3

A kitchen has enough rice for 120 people for 20 days. After 5 days, 30 more people arrive. For how many more days will the remaining rice last? (Everyone eats the same amount.)

Guided solution.

After 5 days, the rice left would feed 120 people for $20 - 5 = 15$ days.
That rice would feed 1 person for $15 \times 120 = 1\,800$ days.
There are now $120 + 30 = 150$ people, so the rice lasts $1\,800 : 150 = 12$ days.
Answer: 12 days.

Example 4

10 workers repair 400 m of road in 5 days. How many metres can 12 workers repair in 6 days? (Everyone works at the same rate.)

Guided solution.

There are three quantities; reduce to "1 worker in 1 day".
In 5 days 1 worker repairs $400 : 10 = 40$ m; in 1 day, $40 : 5 = 8$ m.
12 workers in 6 days repair $8 \times 12 \times 6 = 576$ m.
Answer: 576 m.

Practice

Problem 1

6 identical boxes hold 72 pens altogether. How many pens do 15 such boxes hold?

The same money buys 8 pens or 12 notebooks. A pen costs 2 000 dong more than a notebook. How much money is it?

Your work:

8 Work Problems

① Treat the whole job as one unit

- Treat **the whole job** (or **a full tank**) as 1 unit.
- If someone finishes the job in n hours, then **each hour** they do $\frac{1}{n}$ of the job.
- When several people **work together**, the work done in 1 hour is the *sum* of their separate parts.
- An **outlet pipe** empties the tank, so its part is *subtracted*.
- Time needed = (work to be done) : (work done in 1 hour).

Example 1

The first person can finish a job alone in 6 hours, the second in 3 hours. How long will it take them working together?

Guided solution.

Each hour the first person does $\frac{1}{6}$ of the job and the second $\frac{1}{3}$.

Together they do $\frac{1}{6} + \frac{1}{3} = \frac{1}{2}$ of the job each hour.

Time together: $1 : \frac{1}{2} = 2$ hours.

Answer: 2 hours.

Example 2

Two people together finish a job in 12 days. The first alone would take 20 days. How long would the second take alone?

Guided solution.

Each day both together do $\frac{1}{12}$ of the job and the first does $\frac{1}{20}$.

So the second does $\frac{1}{12} - \frac{1}{20} = \frac{5}{60} - \frac{3}{60} = \frac{1}{30}$ each day, and would take 30 days alone.

Answer: 30 days.

Example 3

Pipe I fills a tank in 4 hours, pipe II in 6 hours. The tank is empty; both pipes run for 1 hour, then pipe I is turned off. How much longer must pipe II run to fill the tank?

Guided solution.

In 1 hour both pipes fill $\frac{1}{4}+\frac{1}{6}=\frac{5}{12}$ of the tank, leaving $1-\frac{5}{12}=\frac{7}{12}$.

Pipe II needs $\frac{7}{12}:\frac{1}{6}=\frac{7}{2}$ hours $=3$ hours 30 minutes.

Answer: 3 hours 30 minutes.

Example 4

An inlet fills a tank in 3 hours; an outlet empties a full tank in 5 hours. Starting empty with both open, how long until the tank is full?

Guided solution.

Each hour the water rises by $\frac{1}{3}-\frac{1}{5}=\frac{2}{15}$ of the tank.

Time to fill: $1:\frac{2}{15}=\frac{15}{2}$ hours $=7$ hours 30 minutes.

Answer: 7 hours 30 minutes.

Practice

Problem 1

An sweeps the schoolyard in 30 minutes, Binh in 20 minutes. How long does it take them together?

Your work:

Problem 2

Pipe I fills a tank in 2 hours, pipe II in 3 hours. Starting empty with both open, how long until it is full?

Problem 48 **

Pipes I and II together fill a tank in 2 hours; pipes II and III in 3 hours; pipe I alone in 3 hours. How long do all three take together?

Your work:

Problem 49 ★★

Worker A alone is 6 hours quicker than worker B alone. Together they finish in 4 hours. How long does each take alone? (Hint: try values.)

Your work:

Problem 50 ★★

A master craftsman working 8 hours a day finishes a job in 12 days. If an assistant who works at half his rate joins him (8 hours a day), how many days will the job take?

Your work:

9 (*) The Method of Two Differences

① Compare two ways of sharing

Many problems describe *the same amount* shared out (or arranged) in **two different ways**. Compare:

- **The difference per share:** how much more each share (each child, each bench, each hour,...) gets in one way than in the other.
- **The total difference:** how much more is needed in one way than in the other. If one way has some *left over* and the other is *short*, the total difference is *left over* + *short*; if both are left over (or both short), subtract the smaller from the larger.

Number of shares = (total difference) : (difference per share). From it, find the amount asked for.

The *method of supposition* rests on the same idea: suppose for a moment that everything is of one kind, then compare with what really happens.

Example 1

A teacher shares sweets among a group. Giving 5 to each child leaves 8 over; giving 7 to each child is 4 short. How many children and how many sweets are there?

Guided solution.

The second time each child gets $7 - 5 = 2$ more.

The second way needs $8 + 4 = 12$ more sweets (the 8 left over, plus 4 more).

Children: $12 : 2 = 6$.

Sweets: $5 \times 6 + 8 = 38$. (*Check:* $7 \times 6 - 4 = 38$.)

Answer: 6 children, 38 sweets.

Example 2

Class 5B sets out benches for a meeting. With 3 pupils per bench, 6 pupils have no seat. With 4 per bench, 2 benches are left empty. How many benches and how many pupils are there?

Guided solution.

Two empty benches in the second way means $4 \times 2 = 8$ more pupils would be needed to fill every bench.

Difference per bench: $4 - 3 = 1$ pupil.

Total difference: $6 + 8 = 14$ pupils.

Benches: $14 : 1 = 14$.
Pupils: $3 \times 14 + 6 = 48$.
Answer: 14 benches, 48 pupils.

Example 3

Some chickens and dogs have 36 heads and 100 legs altogether. How many chickens and how many dogs are there?

Guided solution.

Suppose all 36 animals were chickens: there would be $36 \times 2 = 72$ legs, which is $100 - 72 = 28$ too few.
Swapping one chicken for one dog adds $4 - 2 = 2$ legs.
Dogs: $28 : 2 = 14$; chickens: $36 - 14 = 22$.
Answer: 22 chickens, 14 dogs.

Example 4

Someone travels from home to town. Going 12 km each hour, they arrive 1 hour later than planned; going 15 km each hour, 1 hour early. Find the distance and the planned time.

Guided solution.

In exactly the planned time, at 12 km an hour they would be 12 km short (the late hour); at 15 km an hour they would go 15 km too far.
Difference per hour: $15 - 12 = 3$ km; total difference: $12 + 15 = 27$ km.
Planned time: $27 : 3 = 9$ hours.
Distance: $12 \times (9 + 1) = 120$ km.
Answer: 120 km; 9 hours.

Practice

Problem 1

Sharing notebooks: 4 each leaves 5 over; 5 each is 3 short. Find the number of pupils and of notebooks.

Your work:

Problem 2

Sharing cakes: 3 each leaves 16 over; 5 each still leaves 4 over. How many children and cakes are there?

Your work:

Problem 3

Sharing oranges: 6 each is 2 short; 8 each is 14 short. Find the number of children and of oranges.

Your work:

Problem 4

A school hires buses for a trip. With 40 pupils per bus, 10 have no seat; with 45 per bus, 15 seats are spare. How many buses and pupils are there?

Your work:

Problem 5

Mum takes some money to the market. 5 kg of apples would be 20 000 dong too much; 4 kg would leave 10 000 dong over. Find the price of 1 kg and how much money she has.

Your work:

Problem 6

With 5 people per bench, 4 must stand; with 6 per bench, 1 bench is empty. How many benches and people are there?

Problem 7

A group arrives at a guesthouse. With 4 per room, 6 guests have no room; with 6 per room, 2 rooms are empty. How many rooms and guests are there?

Your work:

Problem 8

Find a number such that 7 times it is 13 more than 50, and 5 times it is 5 less than 50.

Your work:

Problem 9

3 pens and 5 notebooks cost 49 000 dong; 3 pens and 8 notebooks of the same kind cost 64 000 dong. Find the price of a pen and of a notebook.

Your work:

Problem 10

4 pencils and 3 rubbers cost 22 000 dong; 2 pencils and 3 rubbers cost 14 000 dong. Find the price of each.

Your work:

Problem 11

The 30 pupils of class 5C buy 100 notebooks; each boy buys 4 and each girl buys 3. How many boys and girls are there?

Your work:

Problem 12

A cyclist rides from A to B. At 10 km an hour they arrive 1 hour late; at 15 km an hour, 1 hour early. Find the distance AB.

Your work:

Problem 13

Sharing sweets in a group: 4 each leaves 6 over; 6 each is 4 short. How many children and how many sweets are there?

Your work:

Problem 14

Sharing notebooks: 3 each leaves 12 over; 5 each still leaves 2 over. Find the number of pupils and of notebooks.

Your work:

Problem 15

Sharing tangerines: 7 each is 3 short; 9 each is 15 short. Find the number of children and of tangerines.

Your work:

Problem 16

There are 30 chickens and rabbits with 84 legs in all. How many of each are there?

Your work:

Problem 17

A car park holds 25 bicycles (2 wheels) and pedicabs (3 wheels), with 62 wheels in all. How many of each are there?

Your work:

Problem 18

Lan has 20 notes of 2 000 and 5 000 dong, worth 64 000 dong in all. How many of each are there?

Your work:

Problem 19

2 pens and 3 notebooks cost 34 000 dong; 2 pens and 5 notebooks cost 46 000 dong. Find the price of each.

Your work:

Problem 20

3 kg of oranges and 2 kg of apples cost 150 000 dong; 5 kg of oranges and 2 kg of apples cost 200 000 dong. Find the price per kg of each.

Your work:

Problem 21

Find a number such that 6 times it is 14 more than 40, and 4 times it is 4 less than 40.

Your work:

Problem 22

With 4 people on each bench, 3 must stand; with 5 on each bench, 2 benches are empty. How many benches and people are there?

Your work:

Problem 23

Pupils stand in rows. With 6 per row, 4 are left over; with 7 per row (same number of rows), 3 are missing. How many rows and pupils are there?

Your work:

Problem 24

A rider goes from A to B. At 15 km per hour he arrives 2 hours late; at 20 km per hour he arrives 1 hour early. Find the planned time and the distance AB.

Your work:

Problem 25

A test has 10 questions: 10 points for a right answer, 5 points off for a wrong one. Minh answers all and scores 70. How many are right?

Your work:

Problem 26

20 spiders (8 legs) and beetles (6 legs) have 136 legs in all. How many of each are there?

Your work:

Problem 27

10 boats, large ones carrying 6 and small ones carrying 4, carry exactly 48 people. How many of each are there?

Your work:

Problem 28

Binh buys 16 stamps at 3 000 and 5 000 dong, paying 62 000 dong. How many of each does he buy?

Your work:

Problem 29

4 notebooks and 2 pens cost 40 000 dong; 2 notebooks and 3 pens cost 36 000 dong. Find the price of each.

Your work:

Problem 30

Sharing balls among classes: 5 each leaves 3 over; 7 each is 5 short. Find the number of classes and of balls.

Your work:

Challenge – Extension

Problem 31 *

Sharing sweets: 3 each leaves 2 over; 4 each means one child gets only 2. How many children and sweets are there?

Your work:

Problem 32 *

Pupils line up in rows. With 8 per row, 3 are left over; with 9 per row (same number of rows), the last row is 5 short. How many pupils are there?

Your work:

Problem 33 *

A team planned to make 30 items a day. In fact it made 36 a day, finished 2 days early and made 12 extra items. How many items were planned?

Your work:

Problem 34 *

An buys 5 blue pens and 3 red pens for 33 000 dong. Binh buys 3 blue and 5 red pens of the same kinds for 31 000 dong. Find the price of each kind.

Your work:

Problem 35 **

A worker is hired for 30 days. Each working day pays 200 000 dong and each day off costs a 50 000 dong deduction. After 30 days the worker receives 4 750 000 dong. How many days off were taken?

Your work:

Problem 36 **

A contest has 20 problems. Each correct answer scores 5 points; each wrong or skipped one loses 2 points. Minh scores 72. How many did Minh get right?

Your work:

Problem 37 *

Sharing sweets: 5 each leaves 7 over; 6 each means one child gets only 2. Find the number of children and of sweets.

Your work:

Problem 38 *

There are 38 chickens and dogs. The chickens have 16 more legs than the dogs. How many of each are there?

Your work:

Problem 39 *

A worker is hired for 26 days: paid 300 000 dong for each working day and fined 100 000 dong for each day off. He receives 6 200 000 dong. How many days off did he take?

Your work:

Problem 40 *

A car leaves A. At 40 km/h it reaches B at 11 o'clock; at 50 km/h at 10 o'clock. Find AB and the departure time.

Your work:

Problem 41 *

Pupils sit at desks. With 2 per desk, 8 have no seat; with 3 per desk, 1 desk is empty and one desk has only 1 pupil. Find the number of desks and pupils.

Your work:

Problem 42 *

A test has 25 questions: 4 points for each right answer, 1 off for each wrong one. Hoa answers all and scores 70. How many are wrong?

2 shirts and 3 trousers cost 1 100 000 dong; 3 shirts and 2 trousers cost 1 150 000 dong. Find each price.

Your work:

Problem 44 *

Mum buys some oranges. Selling at 30 000 dong/kg she gains 40 000 dong; at 25 000 dong/kg she loses 10 000 dong. Find the amount of oranges and the cost.

Your work:

Problem 45 *

18 spiders (8 legs, no wings) and dragonflies (6 legs, 2 pairs of wings) have 124 legs. How many pairs of wings are there?

Your work:

Problem 46 *

A shop has 45 boxes of cakes, holding 6 or 10 each, 350 cakes in all. How many boxes of each are there?

Your work:

Problem 47 **

An cycles to school. At 12 km/h he is 5 minutes late; at 15 km/h he is 5 minutes early. How far is the school?

Your work:

Problem 48 *

A car park has 50 vehicles: cars (4 wheels) and motorbikes (2 wheels). The cars have 20 more wheels than the motorbikes. How many of each are there?

Your work:

Problem 49 **

A test has 30 questions: 5 points for right, 2 off for wrong, 0 for skipped. Binh scores 112, and has twice as many wrong as skipped. How many are right?

Your work:

Problem 50 *

Hung takes some money to buy notebooks. Buying 8 leaves 4 000 dong; buying 10 is 6 000 dong short. How much money does he have?

Your work:

10 Working Backwards

① Start from the final result

When a problem gives the **final result** of a chain of operations (or a chain of changes), start from that result and **go backwards** one step at a time, using the *inverse operation* at each step:

add $\longleftrightarrow$ subtract multiply $\longleftrightarrow$ divide

- Draw a **flow diagram** of the steps so that none is missed or taken out of order.
- For "take away a fraction, then add (or remove) a few more" problems, undo the *extra units* first and then the *fraction* at each backward step.
- For problems where amounts pass between several people (or jars), make a **table** of the amounts after each transfer and work from the bottom row up.

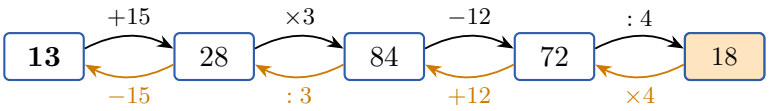

Always **check** by working forwards again.

Example 1

Find a number such that adding 15, multiplying by 3, subtracting 12 and finally dividing by 4 gives 18.

Guided solution.

The diagram (forwards on top, backwards below):

Backwards: $18 \times 4 = 72$;
$72 + 12 = 84$;
$84 : 3 = 28$;
$28 - 15 = 13$.
Check: $(13 + 15) \times 3 = 84$;
$84 - 12 = 72$;
$72 : 4 = 18$.
Answer: 13.

Example 2

A woman takes eggs to market. First she sells half of them and 1 more. Then she sells half of what is left and 1 more. She has 10 eggs left. How many did she bring?

Guided solution.

Undo the second sale: without the extra egg she would have $10 + 1 = 11$ left, which is half of what she had before.
So before the second sale: $11 \times 2 = 22$ eggs.
Undo the first sale: $(22 + 1) \times 2 = 46$ eggs.
Answer: 46 eggs.

Example 3

On day one, $\frac{1}{3}$ of the water in a tank is used; on day two, $\frac{2}{5}$ of what is left. Now 120 litres remain. How much water was in the tank at first?

Guided solution.

After day two, $1 - \frac{2}{5} = \frac{3}{5}$ of the day-one remainder is left.

That remainder was $120 : \frac{3}{5} = 200$ litres.

200 litres is $1 - \frac{1}{3} = \frac{2}{3}$ of the original.

At first: $200 : \frac{2}{3} = 300$ litres.

Answer: 300 litres.

Example 4

Three drums hold 240 litres of oil. First, drum I pours into drum II as much as drum II holds. Then drum II pours into drum III as much as drum III holds. Then drum III pours into drum I as much as drum I holds. Now all three drums hold the same. How much did each hold at first?

Guided solution.

At the end each drum holds $240 : 3 = 80$ litres.
A drum that "receives as much as it holds" doubles; going back, we *halve* the receiving drum and *give* that amount back to the pouring drum.

	Drum I	Drum II	Drum III
At the end	80	80	80
Before step 3	40	80	120
Before step 2	40	140	60
At first	**110**	**70**	**60**

Answer: Drum I: 110 litres; drum II: 70 litres; drum III: 60 litres.

Practice

Problem 1

Find a number such that multiplying it by 4, subtracting 18 and dividing by 2 gives 25.

Your work:

Problem 2

Nam thinks of a number. He multiplies it by 6, adds 8, divides by 2 and subtracts 14, getting 20. What was his number?

Your work:

Problem 3

Find a number such that adding $\frac{1}{2}$ and then multiplying by $\frac{2}{3}$ gives 3.

Your work:

Problem 4

If An's age is doubled, 5 is added and the result is divided by 3, the answer is 9. How old is An?

Your work:

Problem 5

Lan spends $\frac{1}{2}$ of her money on books and $\frac{1}{3}$ of the rest on pens, leaving 20 000 dong. How much did she have at first?

Your work:

Problem 6

Hoa reads $\frac{1}{4}$ of a book on day one, $\frac{1}{3}$ of the remaining pages on day two, and the last 60 pages on day three. How many pages does the book have?

Your work:

Problem 7

Mr Ba sells half his hens and 2 more, then half of the rest and 2 more, and has 8 left. How many hens did he have?

Your work:

Problem 8

At the market Mum first spends half her money and 5 000 dong more, then half the rest and 5 000 more, leaving 10 000 dong. How much did she take?

Your work:

Problem 9

15 litres are poured from tank A into tank B, then 5 litres from B back into A. Now each holds 40 litres. How much did each hold at first?

Your work:

Problem 10

6 oranges move from basket I to basket II, then 2 move from II back to I. Now basket I has 20 and basket II has 30. How many were in each at first?

Your work:

Problem 11

Jar I pours half its water into jar II; then jar II pours $\frac{1}{3}$ of what it holds into jar I. Now jar I has 8 litres and jar II 12. How much did each have at first?

Your work:

Problem 12

Find a number: add 7, multiply by 5, then subtract 10 to get 65.

Your work:

Problem 13

Find a number: multiply by 3, add 12, then divide by 5 to get 9.

Your work:

Problem 14

Find a number: subtract 4, multiply by 6, then add 3 to get 51.

Your work:

Problem 15

Find a number: divide by 2, add 15, then multiply by 4 to get 100.

Your work:

Problem 16

Find x: multiply by 2.5, then subtract 1.5 to get 8.5.

Your work:

Problem 17

Find a decimal: add 2.4, then multiply by 3 to get 12.6.

Your work:

Problem 18

Mai spends 25 000 dong on a book, gets 10 000 dong from Mum, then spends 8 000 dong on a pen and has 17 000 dong left. How much did she start with?

Your work:

Problem 19

A bus leaves the depot. At the first stop 6 get off and 4 get on; at the second 10 get off and 3 get on. Now 21 passengers are aboard. How many were there at the start?

Your work:

Problem 20

Dad's age divided by 4, plus 3, gives 13. How old is Dad?

Your work:

Problem 21

Lan spends $\frac{1}{3}$ of her money, then $\frac{1}{2}$ of the rest, and has 25 000 dong left. How much did she have?

Your work:

Problem 22

On day one $\frac{1}{4}$ of a tank's water is used; on day two $\frac{1}{3}$ of the rest. 300 litres remain. How much was there?

Your work:

Problem 23

A seller first sells half her eggs plus 2, then half the rest plus 1, leaving 9. How many eggs were there?

Your work:

Problem 24

Move 8 pomelos from basket A to B, then 3 from B to A. Now A has 25 and B has 35. How many did each have at first?

Your work:

Problem 25

A shop sells $\frac{2}{5}$ of its rice on day one and half the rest on day two, leaving 45 kg. How much rice was there?

Your work:

Problem 26

Find x if $\left(x - \frac{1}{3}\right) \times \frac{3}{4} = \frac{1}{2}$.

Your work:

Problem 27

An gives Binh $\frac{1}{3}$ of his marbles, then gives Chi 4, and has 12 left. How many did An have?

Your work:

Problem 28

Find a number: multiply by 4, add 0.6, then divide by 2 to get 5.3.

Your work:

Problem 29

From a roll of cloth, first $\frac{1}{4}$ is cut, then 5 m, then half of what remains, leaving 8 m. How long was the roll?

Your work:

Problem 30

Uncle Tu sells $\frac{1}{3}$ of his ducks, then buys 15 more and has 75. How many ducks did he have?

Your work:

Challenge – Extension

Problem 31 *

A shop sells $\frac{1}{3}$ of a roll of cloth and 2 m more, then half of the rest and 3 m more, leaving 12 m. How long was the roll?

Your work:

Problem 32 *

A monkey picks some peaches. Each day it eats half of what it has and 1 more. On the morning of day five it has just 1 left. How many peaches did it pick?

Your work:

Problem 33 *

An, Binh and Cuong have 96 marbles. An gives Binh as many as Binh has; then Binh gives Cuong as many as Cuong has; finally Cuong gives An as many as An has. Now they all have the same. How many did each have at first?

Your work:

Problem 34 **

A, B and C play three rounds of a game. After each round the loser must give each of the others as many marbles as they already have. A loses round 1, B round 2 and C round 3. Afterwards each has 24 marbles. How many did each have at first?

Your work:

Problem 35 *

Each day a monkey eats half its peaches plus 2 more. After 3 days it has 3 left. How many did it start with?

Your work:

Problem 36

Pour from jar A into jar B as much as B holds; then from B into A as much as A holds. Now each has 24 litres. How much did each have at first?

Your work:

Problem 37

A shop sells half its rice plus 5 kg, then $\frac{1}{3}$ of the rest plus 4 kg, then $\frac{1}{4}$ of the rest plus 3 kg, leaving 15 kg. How much was there?

Your work:

Problem 38

Nam thinks of a number. Three times over he doubles it and subtracts 3, ending with 19. What was the number?

Your work:

Problem 39

A team repairs a road: in week one $\frac{1}{4}$ of it plus 3 km; in week two $\frac{1}{3}$ of the rest plus 1 km; in week three the last 9 km. How long is the road?

Your work:

Problem 40

Ms Hanh spends $\frac{2}{5}$ of her pay on food, $\frac{1}{3}$ of the rest on schooling and saves half of what remains, keeping 1 200 000 dong. What is her pay?

Your work:

Problem 41

Grandpa's age minus 4, divided by 7, plus 2, times 5 is 60. How old is he?

Your work:

Problem 42

Duckweed doubles its area every day and covers the whole pond at the end of day 10. On which day did it cover $\frac{1}{4}$ of the pond?

Your work:

Problem 43

Three drums hold 180 litres. Pour 10 l from I to II, then 20 l from II to III, then 5 l from III to I. Now all are equal. How much did each hold?

Your work:

Problem 44

Find x if $(x \times 1.5 - 2.25) : 0.5 = 7.5$.

Your work:

Problem 45

Grandma spends half her money plus 3 000 dong, then half the rest plus 2 000, then half the rest plus 1 000, and has nothing left. How much did she take?

Your work:

Problem 46

Two baskets hold 60 oranges. Move $\frac{1}{3}$ of basket I into II, then $\frac{1}{4}$ of basket II (as it is then) into I. Now they are equal. How many were in each?

Your work:

Problem 47 *

Ha does maths for 45 minutes, rests 15 minutes, then reads for 1 hour 20 minutes, finishing at 21:05. When did she start?

Your work:

Problem 48 *

Think of any number, multiply by 9, add 18, divide by 9, then subtract the number you thought of. Show the result is always 2.

Your work:

Problem 49 **

A snail at the bottom of a 10 m well climbs 3 m each day and slips 2 m each night. On which day does it reach the top?

Your work:

Problem 50 **

Grandma has some apples. The eldest takes half plus half an apple; the second takes half the rest plus half an apple; the youngest takes half the rest plus half an apple, and none are left. No apple is cut. How many were there?

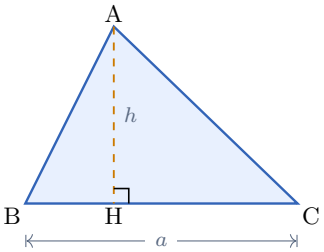

Your work:

11 Triangles and Their Area

① Base, height and area

A **triangle** has 3 sides, 3 vertices and 3 angles. By its angles it is *acute* (three acute angles), *obtuse* (one obtuse angle) or *right-angled* (one right angle).

The segment drawn from a vertex **perpendicular** to the opposite side is a **height**; that side is the **base**. Every triangle has 3 heights.

The **area of a triangle** is the base times the height (in the same unit), divided by 2:

$$S = \frac{a \times h}{2} \qquad h = \frac{S \times 2}{a} \qquad a = \frac{S \times 2}{h}$$

In a right-angled triangle, the two sides at the right angle are each other's base and height.

Example 1

Find the area of a triangle with:

a) base 8 cm, height 5 cm;

b) base 2.5 dm, height 12 cm.

Guided solution.

a) $S = 8 \times 5 : 2 = 20$ cm^2.

b) Use the same unit first: 2.5 dm = 25 cm.

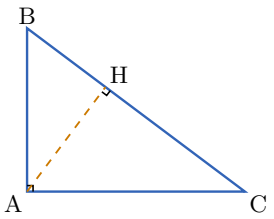

$S = 25 \times 12 : 2 = 150$ cm^2.

Answer: a) 20 cm^2;

b) 150 cm^2.

Example 2

Triangle ABC has a right angle at A, with $AB = 6$ cm, $AC = 8$ cm and $BC = 10$ cm. Find its area and the length of the height AH.

Guided solution.

Take AC as the base; then AB is the height: $S = 6 \times 8 : 2 = 24$ cm^2.

Take BC as the base; then AH is the height: $AH = 24 \times 2 : 10 = 4.8$ cm.

Answer: 24 cm^2;

$AH = 4.8$ cm.

Example 3

A triangle has area 36 cm^2 and base 9 cm. Find its height.

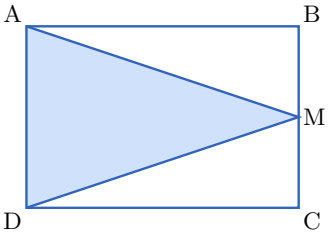

Guided solution.

$h = S \times 2 : a = 36 \times 2 : 9 = 8$ cm.

Answer: 8 cm.

Example 4

Rectangle ABCD has $AB = 12$ cm and $BC = 8$ cm; M is the midpoint of BC. Find the areas of triangles ABM, MCD and AMD.

Guided solution.

$BM = MC = 8 : 2 = 4$ cm.

$S_{ABM} = 12 \times 4 : 2 = 24$ cm^2;

$S_{MCD} = 12 \times 4 : 2 = 24$ cm^2.

$S_{ABCD} = 12 \times 8 = 96$ cm^2, so $S_{AMD} = 96 - 24 - 24 = 48$ cm^2.

Remark: triangle AMD has base AD and height equal to AB, so its area is half the rectangle.

Answer: 24 cm^2; 24 cm^2; 48 cm^2.

Practice

Problem 1

Find the area of a triangle with base a and height h:

a) $a = 15$ cm, $h = 8$ cm;

b) $a = 4.5$ m, $h = 2$ m;

c) $a = \frac{3}{4}$ m, $h = \frac{2}{5}$ m;

d) $a = 1.2$ dm, $h = 15$ cm.

Your work:

Problem 2

Find the area of a right-angled triangle whose two shorter sides are 3.5 dm and 2 dm.

Your work:

Problem 3

A triangle has area 45 cm^2 and height 6 cm. Find its base.

Your work:

Problem 4

A triangular plot has base 40 m and height $\frac{3}{4}$ of the base. Find its area.

Your work:

Problem 5

A triangular card has base 2.4 dm and height $\frac{2}{3}$ of the base. Find its area.

Your work:

Problem 6

Triangle ABC has a right angle at A, $AB = 9$ cm, $AC = 12$ cm and $BC = 15$ cm. Find the height AH.

Your work:

Problem 7

A triangle has the same area as a square of side 6 cm. Its base is 9 cm. Find its height.

Your work:

Problem 8

A triangle has base 18 cm. Lengthening the base by 4 cm (same height) adds 20 cm^2 to the area. Find the original area.

Your work:

Problem 9

Square ABCD has side 10 cm; M is the midpoint of BC. Find the areas of triangle ABM and quadrilateral AMCD.

Your work:

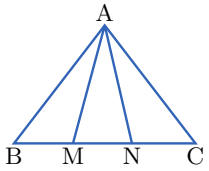

Problem 10

Triangle ABC has area 60 cm^2 and $BC = 15$ cm. Point M lies on BC with $BM = 5$ cm. Find the area of triangle ABM.

Your work:

Problem 11

How many triangles are there in the figure? Name them.

Your work:

Problem 12

Find the area of a triangle with base 14 cm and height 9 cm.

Your work:

Problem 13

Find the area of a triangle with base 2.5 m and height 1.6 m.

Your work:

Problem 14

Find the area of a triangle with base $\frac{3}{4}$ m and height $\frac{2}{5}$ m.

Your work:

Problem 15

Find the area of a triangle with base 3 dm and height 25 cm.

Your work:

Problem 16

Find the area of a right triangle whose legs are 7 cm and 10 cm.

Your work:

Problem 17

A triangle has area 54 cm^2 and base 12 cm. Find its height.

Your work:

Problem 18

A triangle has area 7.5 dm^2 and height 2.5 dm. Find its base.

Your work:

Problem 19

A triangular plot has base 50 m and height 24 m. Each square metre yields 0.8 kg of vegetables. What is the total yield?

Your work:

Problem 20

A triangle has base 16 cm and height $\frac{3}{4}$ of the base. Find its area.

Your work:

Problem 21

The base and height of a triangle add up to 30 cm, and the base is 6 cm longer. Find the area.

Your work:

Problem 22

Triangle ABC has a right angle at A, $AB = 15$ cm, $AC = 20$ cm, $BC = 25$ cm. Find its area and the height AH.

Your work:

Problem 23

Triangle one has base 12 cm and height 8 cm. Triangle two has the same area and base 16 cm. Find its height.

Your work:

Problem 24

Each triangular flag has base 30 cm and height 20 cm. How many square decimetres of cloth do 20 flags need? (Ignore seams.)

Your work:

Problem 25

A right triangle has area 24 cm^2 and one leg 6 cm. Find the other leg.

Your work:

Problem 26

Rectangle ABCD is 12 cm by 8 cm. Diagonal AC cuts it into two triangles. Find the area of each.

Your work:

Problem 27

A triangle has area 150 cm^2. Raising its height by 3 cm (same base) adds 30 cm^2. Find the base and the height.

Your work:

Problem 28

A triangle with base 8 cm has the same area as a square of side 8 cm. Find its height.

Your work:

Problem 29

A triangular field has base 120 m and height 80 m. Give its area in hectares.

Your work:

Problem 30

Triangle ABC has area 48 cm^2; M is the midpoint of BC. Find the area of triangle ABM.

Your work:

Challenge – Extension

Problem 31 ⋆

A triangle has area 120 cm^2. Shortening the base by 3 cm (same height) takes 18 cm^2 off the area. Find the base.

Your work:

Problem 32 ⋆

The two shorter sides of a right-angled triangle add up to 14 cm, and one is 2 cm longer than the other. Find its area.

Your work:

Problem 33 ⋆

Rectangle ABCD has $AB = 16$ cm and $AD = 10$ cm. Point E is on AB with $AE = 6$ cm. Find the areas of triangles ADE, EBC and ECD.

Your work:

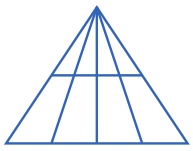

Problem 34 ⋆⋆

Triangle ABC has a right angle at A, $AB = 6$ cm and $AC = 8$ cm. M is on AB with $AM = 2$ cm, and N is on AC with $AN = 4$ cm. Find the area of quadrilateral BMNC.

Your work:

Problem 35 ⋆⋆

How many triangles are there in the figure?

Your work:

Problem 36

In triangle ABC, $BC = 20$ cm. M lies on BC with $BM = 8$ cm, and triangle ABM has area 40 cm^2. Find the area of ABC.

Your work:

Problem 37

Rectangle ABCD has $AB = 20$ cm, $AD = 12$ cm. M is the midpoint of AB and N the midpoint of BC. Find the area of triangle DMN.

Your work:

Problem 38

Square ABCD has side 12 cm, and E is any point on AB. Find the area of triangle ECD and the total area of triangles AED and EBC.

Your work:

Problem 39

A triangle has area 40 cm^2. If its base is tripled and its height halved, what is the new area?

Your work:

Problem 40

The legs of a right triangle add up to 23 cm and differ by 7 cm. Find its area.

Your work:

Problem 41

Triangle ABC has area 90 cm^2. M on BC makes MC twice BM. Find the areas of ABM and AMC.

Your work:

Problem 42

Triangle ABC has a right angle at A, $AB = 12$ cm, $AC = 16$ cm. M is the midpoint of AC. Compare the areas of ABM and BMC.

Your work:

Problem 43

Triangle ABC has $BC = 24$ cm and height $AH = 10$ cm. BC is extended beyond C by $CD = 6$ cm. Find the areas of ACD and ABD.

Your work:

Problem 44

Two triangles have equal heights. The base of the first is $\frac{2}{3}$ of the second's, and the second's area

is 24 cm^2 larger. Find each area.

Your work:

Problem 45

A garden is 40 m by 25 m. Flowers grow on a triangle whose base is one long side and whose apex is on the opposite side; grass covers the rest. Find both areas.

Your work:

A square has a diagonal of 8 cm. Find its area.

Your work:

Problem 49 ★★

Triangle ABC has area 80 cm^2. M is the midpoint of BC and N the midpoint of AM. Find the area of BNC.

Your work:

Problem 50 ★★

Triangle ABC has area 120 cm^2. M is on BC with $BM = \frac{1}{4}BC$; N is on AM with $AN = \frac{2}{3}AM$. Find the areas of ABN and NBM.

Your work:

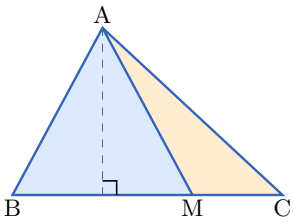

12 (*) Comparing Areas of Triangles

① Same height, compare the bases

- Two triangles with **the same height** have areas in the same ratio as **their bases**. For example, if M is on BC then

$$\frac{S_{ABM}}{S_{AMC}} = \frac{BM}{MC}.$$

- Two triangles with **the same base** have areas in the same ratio as **their heights**.
- The segment from a vertex to the **midpoint** of the opposite side splits a triangle into two triangles of equal area.

To compare two triangles, it often helps to pass through a "middle" triangle that shares a height with each of them.

Example 1

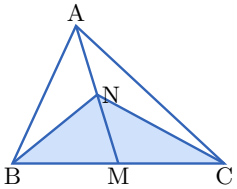

Triangle ABC has area 45 cm^2. Point M is on BC with BM twice MC. Find the areas of triangles ABM and AMC.

Guided solution.

Triangles ABM and AMC share the height from A, so their areas are in the ratio $BM : MC = 2 : 1$.
If S_{AMC} is 1 part, S_{ABM} is 2 parts and S_{ABC} is 3 parts.
$S_{AMC} = 45 : 3 = 15$ cm^2;
$S_{ABM} = 15 \times 2 = 30$ cm^2.
Answer: 30 cm^2 and 15 cm^2.

Example 2

Triangle ABC has area 60 cm^2; M is the midpoint of BC and N is the midpoint of AM. Find the areas of triangles ABN and BNC.

Guided solution.

M is the midpoint of BC, so $S_{ABM} = S_{AMC} = 60 : 2 = 30$ cm^2.
N is the midpoint of AM, so $S_{ABN} = S_{NBM} = 30 : 2 = 15$ cm^2; likewise $S_{NMC} = 15$ cm^2.
$S_{BNC} = S_{NBM} + S_{NMC} = 15 + 15 = 30$ cm^2.
Answer: $S_{ABN} = 15$ cm^2;
$S_{BNC} = 30$ cm^2.

Example 3

Triangle ABC has area 72 cm^2. M is on AB with $AM = \frac{1}{3}AB$, and N is on AC with $AN = \frac{1}{2}AC$. Find the areas of triangle AMN and quadrilateral BMNC.

Guided solution.

Join M to C (the "middle" triangle AMC).

AMC and ABC share the height from C, and $AM = \frac{1}{3}AB$, so $S_{AMC} = \frac{1}{3} \times 72 = 24$ cm^2.

AMN and AMC share the height from M, and $AN = \frac{1}{2}AC$, so $S_{AMN} = \frac{1}{2} \times 24 = 12$ cm^2.

$S_{BMNC} = 72 - 12 = 60$ cm^2.
Answer: 12 cm^2; 60 cm^2.

Example 4

Square ABCD has side 12 cm; M is the midpoint of AB and N the midpoint of BC. Find the area of triangle DMN.

Guided solution.

Take the square and remove the three right-angled corner triangles:
$S_{AMD} = 6 \times 12 : 2 = 36$;
$S_{MBN} = 6 \times 6 : 2 = 18$;
$S_{NCD} = 6 \times 12 : 2 = 36$ cm^2.
$S_{DMN} = 12 \times 12 - 36 - 18 - 36 = 54$ cm^2.
Answer: 54 cm^2.

Practice

Problem 1

Triangle ABC has area 40 cm^2. M is on BC with $BM = 3$ cm and $MC = 5$ cm. Find the areas of ABM and AMC.

Your work:

Problem 2

In triangle ABC, M is the midpoint of BC and $S_{ABM} = 18$ cm^2. Find S_{ABC}.

Your work:

Problem 3

Triangle ABC has area 90 cm^2. D is on AC with $AD = \frac{2}{3}AC$. Find the areas of ABD and BDC.

Your work:

Problem 4

Points M and N divide side BC of triangle ABC into three equal parts $BM = MN = NC$. If $S_{AMN} = 15$ cm^2, find S_{ABC}.

Your work:

Problem 5

Triangle ABC has area 20 cm^2. Extend BC beyond C to D with $CD = BC$. Find the areas of ACD and ABD.

Your work:

Problem 6

Triangle ABC has area 60 cm^2; M is the midpoint of BC; N is on AC with $AN = \frac{1}{3}AC$. Find S_{MNC}.

Your work:

Problem 7

Triangle ABC has area 54 cm^2. M is on BC with $BM = \frac{1}{3}BC$; N is the midpoint of AM. Find the areas of BNM and ANC.

Your work:

Problem 8

Triangle ABC has area 48 cm^2. M is on AB with $AM = \frac{2}{3}AB$; N is on AC with $AN = \frac{3}{4}AC$. Find the areas of AMN and BMNC.

Your work:

Problem 9

In triangle ABC, D is on BC with $BD = \frac{1}{4}BC$, and $S_{ABD} = 12$ cm^2. Find S_{ADC}.

Your work:

Problem 10

Triangle ABC has area 60 cm^2. M on BC divides it so that $BM : MC = 1 : 2$. Find the areas of ABM and AMC.

Your work:

Problem 11

Triangle ABC has area 84 cm^2. M on BC divides it so that $BM : MC = 3 : 4$. Find the areas of ABM and AMC.

Your work:

Problem 12

Triangle ABC has area 100 cm^2. M on BC divides it so that $BM : MC = 2 : 3$. Find the areas of ABM and AMC.

Your work:

Problem 13

Triangle ABC has area 72 cm^2. M on BC divides it so that $BM : MC = 5 : 1$. Find the areas of ABM and AMC.

Your work:

Problem 14

Triangle ABC has area 45 cm^2. M on BC divides it so that $BM : MC = 4 : 5$. Find the areas of ABM and AMC.

Your work:

Problem 15

In triangle ABC, M on BC has $BM = \frac{1}{3}BC$. Triangle ABM has area 15 cm^2. Find the areas of ABC and AMC.

Your work:

Problem 16

In triangle ABC, M on BC has $BM = \frac{2}{5}BC$. Triangle ABM has area 24 cm^2. Find the areas of ABC and AMC.

Your work:

Problem 17

In triangle ABC, M on BC has $BM = \frac{3}{4}BC$. Triangle ABM has area 21 cm^2. Find the areas of ABC and AMC.

Your work:

Problem 18

In triangle ABC, M on BC has $BM = \frac{1}{6}BC$. Triangle ABM has area 12 cm^2. Find the areas of ABC and AMC.

Your work:

Problem 19

Triangle ABC has area 80 cm^2 and $BC = 16$ cm. Point M on BC makes triangle ABM have area 30 cm^2. Find BM.

Your work:

Problem 20

Triangle ABC has area 96 cm^2 and $BC = 12$ cm. Point M on BC makes triangle ABM have area 36 cm^2. Find BM.

Your work:

Problem 21

Triangle ABC has area 75 cm^2 and $BC = 10$ cm. Point M on BC makes triangle ABM have area 45 cm^2. Find BM.

Your work:

Problem 22

Triangle ABC has area 36 cm^2. Extend BC beyond C by $CD = \frac{1}{2}BC$. Find the areas of ACD and ABD.

Your work:

Problem 23

Triangle ABC has area 50 cm^2. Extend BC beyond C by $CD = \frac{2}{5}BC$. Find the areas of ACD and ABD.

Your work:

Problem 24

Triangle ABC has area 28 cm^2. Extend BC beyond C by $CD = 2 \times BC$. Find the areas of ACD and ABD.

Your work:

Problem 25

Triangle ABC has area 60 cm^2. M on AB has $AM = \frac{1}{2}AB$; N on AC has $AN = \frac{1}{3}AC$. Find the areas of AMN and of quadrilateral BMNC.

Your work:

Problem 26

Triangle ABC has area 90 cm^2. M on AB has $AM = \frac{2}{3}AB$; N on AC has $AN = \frac{1}{2}AC$. Find the areas of AMN and of quadrilateral BMNC.

Your work:

Problem 27

Triangle ABC has area 84 cm^2. M on AB has $AM = \frac{3}{4}AB$; N on AC has $AN = \frac{2}{3}AC$. Find the areas of AMN and of quadrilateral BMNC.

Your work:

Problem 28

Triangles ABC and DBC share the base BC. The height from A is 8 cm and from D is 6 cm. If $S_{ABC} = 40$ cm^2, find S_{DBC}.

Your work:

Problem 29

Triangles ABC and DBC share the base BC. The height from A is 9 cm and from D is 12 cm. If $S_{ABC} = 54$ cm^2, find S_{DBC}.

Your work:

Problem 30

Triangles ABC and DBC share the base BC. The height from A is 10 cm and from D is 4 cm. If $S_{ABC} = 35$ cm^2, find S_{DBC}.

Your work:

Challenge – Extension

Problem 31 *

Triangle ABC has area 64 cm^2; M and N are the midpoints of AB and AC. Find the areas of AMN and BMNC.

Your work:

Problem 32 *

Triangle ABC has area 30 cm^2. Extend AB beyond B to D with $BD = AB$, and AC beyond C to E with $CE = AC$. Find S_{ADE}.

Your work:

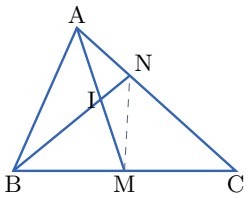

Problem 33 *

Triangle ABC has area 120 cm^2. D is on BC with $BD = 2 \times DC$; E is the midpoint of AD. Find S_{BEC}.

Triangle ABC has area 15 cm^2. Extend AB beyond B by $BD = 2 \times AB$ and AC beyond C by $CE = 2 \times AC$. Find the area of ADE.

Your work:

Problem 43 **

Triangle ABC has area 80 cm^2. M, N, P lie on AB, BC, CA with $AM = \frac{1}{4}AB$, $BN = \frac{1}{4}BC$, $CP = \frac{1}{4}CA$. Find the area of MNP.

Your work:

Problem 44 ⋆⋆

Triangle ABC has area 72 cm^2. M, N, P lie on AB, BC, CA with $AM = \frac{1}{3}AB$, $BN = \frac{1}{3}BC$, $CP = \frac{1}{3}CA$. Find the area of MNP.

Your work:

Problem 45 ⋆

In triangle ABC, M on BC has $BM : MC = 3 : 1$. Triangle ABM is 20 cm^2 larger than AMC. Find the area of ABC.

Your work:

Problem 46 ⋆

In triangle ABC, M on BC has $BM : MC = 5 : 2$. Triangle ABM is 24 cm^2 larger than AMC. Find the area of ABC.

Your work:

Problem 47

Rectangle ABCD has $AB = 24$ cm, $BC = 16$ cm. M on AB has $AM = 8$ cm; N on BC has $BN = 6$ cm. Find the area of triangle DMN.

Your work:

Problem 48

Rectangle ABCD has $AB = 30$ cm, $BC = 20$ cm. M on AB has $AM = 12$ cm; N on BC has $BN = 10$ cm. Find the area of triangle DMN.

Your work:

Problem 49

Rectangle ABCD has $AB = 18$ cm, $BC = 12$ cm. M on AB has $AM = 6$ cm; N on BC has $BN = 4$ cm. Find the area of triangle DMN.

Your work:

Problem 50

Triangle ABC has $BC = 16$ cm. Extending BC beyond C by 5 cm gives a triangle 25 cm^2 larger. Find the area of ABC.

(*) Comparing Areas of Triangles

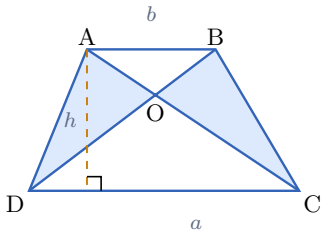

Your work:

13 Trapezia and Their Area

① Two parallel bases

A **trapezium** is a quadrilateral with *one pair of parallel opposite sides*: the **longer base** and the **shorter base**. The other two sides are the **legs**. A trapezium with one leg perpendicular to the bases is a **right trapezium**.

The **height** is the distance between the bases.

$$S = \frac{(a+b)\times h}{2} \qquad h = \frac{S\times 2}{a+b} \qquad a+b = \frac{S\times 2}{h}$$

The diagonals. In trapezium ABCD (AB parallel to CD), triangles ACD and BCD share base CD and have equal heights, so $S_{ACD} = S_{BCD}$; removing the common part gives $S_{AOD} = S_{BOC}$.

Example 1

Find the area of a trapezium with bases 12 cm and 8 cm and height 5 cm.

Guided solution.

$S = (12+8)\times 5 : 2 = 50$ cm^2.

Answer: 50 cm^2.

Example 2

A trapezium-shaped field has a longer base of 120 m; the shorter base is $\frac{2}{3}$ of the longer, and the height is the mean of the two bases. Every 100 m^2 yields 64 kg of paddy. How much paddy does the field yield?

Guided solution.

Shorter base: $120 \times \frac{2}{3} = 80$ m.

Height: $(120+80) : 2 = 100$ m.

Area: $(120+80)\times 100 : 2 = 10\,000$ m^2.

Paddy: $64 \times (10\,000 : 100) = 6\,400$ kg.

Answer: 6 400 kg.

Example 3

A trapezium has area 60 cm^2 and height 6 cm; the longer base is 4 cm longer than the shorter. Find both bases.

Guided solution.

Sum of the bases: $60 \times 2 : 6 = 20$ cm.
This is a sum-and-difference problem: longer base $(20 + 4) : 2 = 12$ cm, shorter 8 cm.
Answer: 12 cm and 8 cm.

Example 4

Trapezium ABCD has shorter base $AB = 6$ cm, longer base $CD = 9$ cm and height 4 cm. Find the areas of triangles ABD and BCD, and show that $S_{AOD} = S_{BOC}$ (O is where the diagonals cross).

Guided solution.

Both triangles have the trapezium's height: $S_{ABD} = 6 \times 4 : 2 = 12$ cm^2 and $S_{BCD} = 9 \times 4 : 2 = 18$ cm^2.
$S_{ACD} = S_{BCD} = 18$ cm^2 (same base CD, same height).
Removing their common part, triangle OCD, gives $S_{AOD} = S_{BOC}$.
Answer: 12 cm^2; 18 cm^2.

Practice

Problem 1

Find the area of a trapezium with bases a, b and height h:

a) $a = 14$ cm, $b = 6$ cm, $h = 7$ cm;

b) $a = 2.8$ m, $b = 1.6$ m, $h = 0.5$ m;

c) $a = \frac{3}{4}$ dm, $b = \frac{1}{2}$ dm, $h = \frac{2}{3}$ dm;

d) $a = 1.5$ dm, $b = 9$ cm, $h = 8$ cm.

Your work:

Problem 2

A right trapezium has bases 10 cm and 7 cm, and the leg perpendicular to them is 6 cm. Find its area.

Your work:

Problem 3

A trapezium has area 72 cm^2 and bases 10 cm and 14 cm. Find its height.

Your work:

Problem 4

A trapezium has area 45 m^2, height 5 m and shorter base 7 m. Find the longer base.

Your work:

Problem 5

A trapezium-shaped field has bases 60 m and 40 m and height 30 m. Every 100 m^2 yields 70 kg of paddy. How much paddy does the field yield?

Your work:

Problem 6

A trapezium's bases add up to 48 cm; the shorter is $\frac{3}{5}$ of the longer, and the height is $\frac{1}{4}$ of the longer base. Find its area.

Your work:

Problem 7

A trapezium has bases 25 cm and 15 cm. Lengthening the longer base by 5 cm adds 20 cm^2 to the area. Find the original area.

Your work:

Problem 8

Rectangle ABCD has $AB = 20$ cm and $BC = 12$ cm. M is on AB with $AM = 8$ cm. Find the area of trapezium MBCD.

Your work:

Problem 9

Trapezium ABCD has $AB = 4$ cm, $CD = 10$ cm and height 6 cm. Find the areas of triangles ABC and ACD.

Your work:

Problem 10

Find the area of a trapezium with bases 15 cm and 9 cm and height 6 cm.

Your work:

Problem 11

Find the area of a trapezium with bases 6.5 cm and 3.5 cm and height 4.2 cm.

Your work:

Problem 12

Find the area of a trapezium with bases $\frac{3}{4}$ m and $\frac{1}{2}$ m and height $\frac{2}{3}$ m.

Your work:

Problem 13

Find the area of a trapezium with bases 14 dm and 10 dm and height 7.5 dm.

Your work:

Problem 14

Find the area of a trapezium with bases 1.2 m and 80 cm and height 5 dm.

Your work:

Problem 15

A trapezium has area 84 cm^2 and bases 16 cm and 12 cm. Find its height.

Your work:

Problem 16

A trapezium has area 45 cm^2 and bases 8.5 cm and 6.5 cm. Find its height.

In trapezium ABCD the shorter base AB is $\frac{2}{3}$ of the longer base CD. Triangle ABD has area 18 cm^2. Find the area of the trapezium.

Your work:

Problem 42 **

Trapezium ABCD (AB parallel to CD) has diagonals meeting at O. $S_{AOB} = 4$ cm^2 and $S_{BOC} = 6$ cm^2. Find the area of the trapezium.

Your work:

Problem 43 **

Trapezium ABCD (AB parallel to CD) has diagonals meeting at O. $S_{AOB} = 9$ cm^2 and $S_{BOC} = 12$ cm^2. Find the area of the trapezium.

Your work:

Problem 44 ★★

Trapezium ABCD (AB parallel to CD) has diagonals meeting at O. $S_{AOB} = 2$ cm^2 and $S_{BOC} = 6$ cm^2. Find the area of the trapezium.

Your work:

Problem 45 ★

Trapezium ABCD has right angles at A and D, $AB = 8$ cm, $CD = 14$ cm, $AD = 10$ cm. M is the midpoint of AD. Find the area of triangle MBC.

Your work:

Problem 46 ★

Trapezium ABCD has right angles at A and D, $AB = 5$ cm, $CD = 11$ cm, $AD = 12$ cm. M is the midpoint of AD. Find the area of triangle MBC.

Your work:

Problem 47

A right trapezium has bases 10 cm and 16 cm. Lengthening the shorter base by 6 cm makes a rectangle 24 cm^2 larger. Find the trapezium's area.

Your work:

Problem 48

A right trapezium has bases 14 cm and 20 cm. Lengthening the shorter base by 6 cm makes a rectangle 27 cm^2 larger. Find the trapezium's area.

Your work:

Problem 49

A trapezium with bases 20 cm and 16 cm has the same area as a square of side 12 cm. Find its height.

Your work:

Problem 50

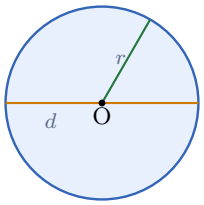

Diagonal AC splits trapezium ABCD (AB parallel to CD) into triangles with $S_{ABC} = 24$ cm^2 and $S_{ACD} = 40$ cm^2. The height is 8 cm. Find both bases.

Your work:

14 Circles: Circumference and Area

① Centre, radius, diameter

Every point on a **circle** is the same distance from the **centre** O. A segment from the centre to the circle is a **radius** r; a segment through the centre joining two points of the circle is a **diameter** d, and $d = r \times 2$.

We use the number 3.14 (called "pi") to calculate:

$$C = d \times 3.14 = r \times 2 \times 3.14 \qquad S = r \times r \times 3.14$$

- Given the circumference: $d = C : 3.14$.
- Given the area: find $r \times r = S : 3.14$, then the number r.
- If the radius is multiplied by k, the circumference is multiplied by k and the area by $k \times k$.

Example 1

Find the circumference and area of a circle of radius 5 cm.

Guided solution.

$C = 5 \times 2 \times 3.14 = 31.4$ cm.

$S = 5 \times 5 \times 3.14 = 78.5$ cm^2.

Answer: 31.4 cm; 78.5 cm^2.

Example 2

A circle has circumference 18.84 dm. Find its area.

Guided solution.

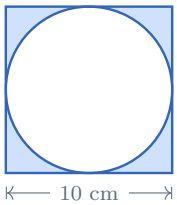

Diameter: $18.84 : 3.14 = 6$ dm; radius: 3 dm.

$S = 3 \times 3 \times 3.14 = 28.26$ dm^2.

Answer: 28.26 dm^2.

Example 3

A square has side 10 cm. A circle inside it touches all four sides.
Find the shaded area (the part of the square outside the circle).

Guided solution.

The circle's diameter equals the side of the square: $d = 10$ cm, $r = 5$ cm.

$S_{\text{square}} = 10 \times 10 = 100$ cm^2;

$S_{\text{circle}} = 5 \times 5 \times 3.14 = 78.5$ cm^2.

Shaded part: $100 - 78.5 = 21.5$ cm^2.

Answer: 21.5 cm^2.

Example 4

A cart wheel has a diameter of 0.6 m. How far does the cart travel when the wheel turns 100 times?

Guided solution.

Each turn moves the cart by the wheel's circumference: $0.6 \times 3.14 = 1.884$ m.
100 turns: $1.884 \times 100 = 188.4$ m.
Answer: 188.4 m.

Practice

Problem 1

Find the circumference and area of a circle with:

a) $r = 3$ cm; **b)** $r = 0.5$ dm; **c)** $d = 8$ m.

Your work:

Problem 2

A circle has circumference 12.56 cm. Find its radius and area.

Your work:

Problem 3

A bicycle wheel has a diameter of 65 cm. How many kilometres does the bicycle travel in 1 000 turns of the wheel?

Your work:

Problem 4

A car wheel travels 1 099 m in 500 turns. Find its diameter.

Your work:

Problem 5

The minute hand of a clock is 10 cm long. How far does its tip travel in 1 hour? In 15 minutes?

Your work:

Problem 6

Find the area and perimeter of a semicircle with diameter 8 cm.

Your work:

Problem 7

A round flower bed has a radius of 10 m. A path 1 m wide is built all round it. Find the area of the path.

Your work:

Problem 8

A square sits inside a circle of radius 5 cm with its four corners on the circle. Find the area of the part of the circle outside the square.

Your work:

Problem 9

If the radius of a circle is multiplied by 3, by how many times are its circumference and area multiplied? Check with $r = 1$ cm.

Your work:

Problem 10

Find the circumference and area of a circle of radius 3 cm.

Your work:

Problem 11

Find the circumference and area of a circle of radius 2.5 cm.

Your work:

Problem 12

Find the circumference and area of a circle of radius 0.8 m.

Your work:

Problem 13

Find the circumference and area of a circle of radius 12 dm.

Your work:

Problem 14

Find the circumference and area of a circle of diameter 10 cm.

Your work:

Problem 15

Find the circumference and area of a circle of diameter 4.2 cm.

Your work:

Problem 16

Find the circumference and area of a circle of diameter 2.4 m.

Your work:

Problem 17

A circle has circumference 43.96 cm. Find its radius and area.

Your work:

Problem 18

A circle has circumference 21.98 cm. Find its radius and area.

Your work:

Problem 19

A circle has circumference 6.28 m. Find its radius and area.

Your work:

Problem 20

A circle has area 113.04 cm^2. Find its radius and circumference.

Your work:

Problem 21

A circle has area 12.56 m^2. Find its radius and circumference.

Your work:

Problem 22

A wheel has diameter 0.5 m. How far does it travel in 200 turns?

Your work:

Problem 23

A wheel has diameter 0.7 m. How far does it travel in 1 000 turns?

Your work:

Problem 24

A bicycle wheel travels 816.4 m in 400 turns. Find its diameter.

Your work:

Problem 25

Find the area and perimeter of a semicircle with diameter 10 cm.

Your work:

Problem 26

Find the area and perimeter of a semicircle with diameter 6 cm.

Your work:

Problem 27

A ceiling-fan blade is 0.6 m long from the centre. Find the area of the circle its tip sweeps out.

Your work:

Problem 28

A round pond has diameter 20 m. Fencing costs 50 000 dong per metre. How much does it cost to fence the pond?

Your work:

Problem 29

Find the area of a quarter circle of radius 4 cm.

Your work:

Problem 30

Find the area of a quarter circle of radius 10 cm.

Your work:

Challenge – Extension

Problem 31

A circle has area 50.24 cm^2. Find its circumference.

Your work:

Problem 32

If a circle's radius grows by 2 cm, by how much does its circumference grow? Does the answer depend on the original radius?

Your work:

Problem 33

A large semicircle has diameter $AB = 12$ cm. M is the midpoint of AB, and two small semicircles are drawn on AM and MB. Compare the length of the large arc with the total length of the two small arcs.

Your work:

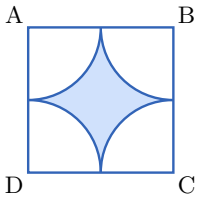

Problem 34

Two circles share centre O, with radii 3 cm and 5 cm. Find the area between them (the ring).

Your work:

Problem 35 ★★

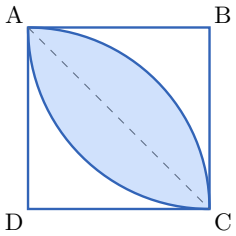

Square ABCD has side 8 cm. Four quarter circles of radius 4 cm are drawn with centres at the four corners. Find the shaded area.

Your work:

Problem 36 ★★

Square ABCD has side 10 cm. Two quarter circles of radius 10 cm are drawn with centres B and D; they overlap in the shaded "leaf". Find the area of the leaf.

Your work:

Problem 37 ★

Two circles with the same centre have radii 4 m and 6 m. Find the area of the ring between them.

Your work:

Problem 38 ★

A round flower bed has radius 8 m, with a path 2 m wide around it. Find the area of the path.

Your work:

Problem 39

A square has its four corners on a circle of radius 6 cm. Find the area of the circle outside the square.

Your work:

Problem 40

A small wheel of radius 0.3 m makes 150 turns. A large wheel covers the same distance in 90 turns. Find its radius.

Your work:

Problem 41

A circle has the same perimeter as a square of side 15.7 cm. Which has the larger area, and by how much?

Your work:

Problem 42

A circle has area 12.56 cm^2. If its radius is doubled, what is the new area?

Your work:

Problem 43 *

A circle's radius grows by 1.5 cm. By how much does its circumference grow?

Your work:

Problem 44 *

An old bicycle has a front wheel of diameter 0.5 m and a back wheel of diameter 1 m. When the back wheel turns 100 times, how many times does the front wheel turn?

Your work:

Problem 45 *

A running track has two straights of 100 m and two semicircular ends of diameter 60 m. Find the length of one lap and the area inside.

Your work:

Problem 46 **

A quarter (bounded by two perpendicular radii) is cut from a circular card of radius 10 cm. Find the area and perimeter of what is left.

Your work:

Problem 47 ⋆⋆

A goat is tied to an outside corner of a square pen of side 6 m with a 4 m rope. It cannot enter the pen. Find the area it can graze.

Your work:

Problem 48 ⋆

Two circles' circumferences differ by 12.56 cm, and the larger radius is 3 times the smaller. Find the area of the larger circle.

Your work:

Problem 49 ⋆

A minute hand is 12 cm long. What area does it sweep in 20 minutes?

Your work:

Problem 50 ⋆

A tractor wheel of diameter 0.7 m makes 120 turns a minute. How far does the tractor go in 10 minutes?

Your work:

15 Mixed Practice on Area

① Split, add on, cut away

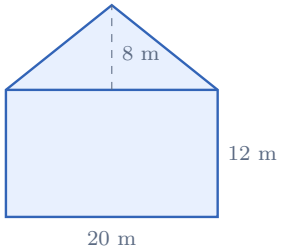

To find the area of a composite shape, reduce it to shapes whose formulas we know:

Rectangle	$a \times b$	Triangle	$a \times h : 2$
Square	$a \times a$	Trapezium	$(a + b) \times h : 2$
Circle	$r \times r \times 3.14$	Semicircle	$r \times r \times 3.14 : 2$

- **Split:** cut the shape into familiar pieces and *add* their areas.
- **Complete and subtract:** fill it out to a large familiar shape and *subtract* what was added.
- Always change measurements to **the same unit** first; $1\ \text{m}^2 = 100\ \text{dm}^2 = 10\,000\ \text{cm}^2$.

Example 1

A plot of land is shaped as shown: a rectangle 20 m by 12 m with a triangle on top whose base is the rectangle's length and whose height is 8 m. Find the area of the plot.

Guided solution.

Split it into a rectangle and a triangle:

$S_{\text{rectangle}} = 20 \times 12 = 240\ \text{m}^2$;

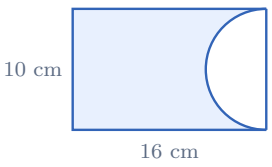

$S_{\text{triangle}} = 20 \times 8 : 2 = 80\ \text{m}^2$.

Plot: $240 + 80 = 320\ \text{m}^2$.

Answer: $320\ \text{m}^2$.

Example 2

A semicircle whose diameter is the width of a 16 cm by 10 cm wooden board is cut out of it (see the figure). Find the area of the wood that is left.

Guided solution.

$S_{\text{board}} = 16 \times 10 = 160$ cm^2.

The semicircle has $r = 5$ cm: $5 \times 5 \times 3.14 : 2 = 39.25$ cm^2.

Wood left: $160 - 39.25 = 120.75$ cm^2.

Answer: 120.75 cm^2.

Example 3

On a map with scale 1 : 1 000, a trapezium-shaped garden has bases 5 cm and 3 cm and height 4 cm. Find the real area of the garden.

Guided solution.

Real lengths: 5 cm $\rightarrow$ 5 000 cm = 50 m;
3 cm $\rightarrow$ 30 m;
4 cm $\rightarrow$ 40 m.
Real area: $(50 + 30) \times 40 : 2 = 1\,600$ m^2.

Note: change to real lengths *first*, then compute the area.

Answer: 1 600 m^2.

Example 4

A rectangular floor is 8 m by 6 m. It is tiled with square tiles of side 40 cm costing 25 000 dong each. How many tiles are needed, and what do they cost? (Ignore the grout.)

Guided solution.

Floor: $8 \times 6 = 48$ m^2 $= 480\,000$ cm^2.

One tile: $40 \times 40 = 1\,600$ cm^2.

Tiles: $480\,000 : 1\,600 = 300$.

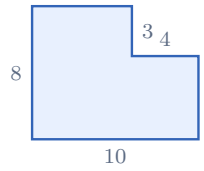

Cost: $25\,000 \times 300 = 7\,500\,000$ dong.

Answer: 300 tiles; 7 500 000 dong.

Practice

Problem 1

Find the area of the L-shape (measurements in centimetres).

Your work:

Problem 2

A rectangular plot is 25 m long, and its width is $\frac{3}{5}$ of its length. A house with a square base of side 10 m is built on it. Find the area left.

Your work:

Problem 3

A rectangular schoolyard is 50 m by 30 m. A round flower bed of radius 3 m is in the middle. Find the rest of the yard's area.

Your work:

Problem 4

A trapezium-shaped garden has bases 30 m and 20 m and height 16 m. A quarter of it is dug out for a pond and the rest is planted. Find the planted area.

Your work:

Problem 5

On a 1 : 500 map a rectangular pitch is 6 cm by 4 cm. Find its real area.

Your work:

Problem 6

A classroom 6 m by 4 m is tiled with square tiles of side 50 cm. How many tiles are needed?

Your work:

Problem 7

Four equal squares of side 0.2 m are cut from the corners of a 2 m by 1.5 m metal sheet. Find the area of metal left.

Your work:

Problem 8

A shape is made of a square of side 6 cm and a semicircle drawn outwards on one side of the square. Find its area and perimeter.

Your work:

Problem 9

The diagonals of rectangle ABCD ($AB = 12$ cm, $BC = 8$ cm) cross at O. Show that triangles OAB, OBC, OCD and ODA have equal areas, and find each area.

Your work:

Problem 10

On a map at scale $1 : 1\,000$, a rectangular plot is 6 cm by 4 cm. Find its real area.

Your work:

Problem 11

On a map at scale 1 : 2 000, a rectangular plot is 5 cm by 3 cm. Find its real area.

Your work:

Problem 12

On a map at scale 1 : 500, a rectangular plot is 8 cm by 5 cm. Find its real area.

Your work:

Problem 13

A room floor is 6 m by 4 m, tiled with square tiles of side 40 cm costing 20 000 dong each. Find the number of tiles and their cost (ignore the joints).

Your work:

Problem 14

A room floor is 8 m by 5 m, tiled with square tiles of side 50 cm costing 35 000 dong each. Find the number of tiles and their cost (ignore the joints).

Your work:

Problem 15

A room floor is 4.8 m by 3.6 m, tiled with square tiles of side 60 cm costing 45 000 dong each. Find the number of tiles and their cost (ignore the joints).

Your work:

Problem 16

A rectangular plot is 30 m long and its width is $\frac{2}{3}$ of the length. A 12 m × 8 m house is built on it. Find the remaining area.

Your work:

Problem 17

A rectangular plot is 40 m long and its width is $\frac{3}{4}$ of the length. A 15 m × 10 m house is built on it. Find the remaining area.

Your work:

Problem 18

A playground is 40 m by 25 m with a round sandpit of radius 3 m in the middle. Find the area of the rest.

Your work:

Problem 19

A playground is 30 m by 20 m with a round sandpit of radius 5 m in the middle. Find the area of the rest.

Your work:

Problem 20

A shape is a square of side 8 cm with a semicircle on one side (diameter = that side), outward. Find its area.

Your work:

Problem 21

A shape is a square of side 10 cm with a semicircle on one side (diameter = that side), outward. Find its area.

Your work:

Problem 22

From a 3 dm × 2 dm card, a square of side 0.4 dm is cut from each corner. Find the area left.

Your work:

Problem 23

From a 5 dm × 4 dm card, a square of side 0.5 dm is cut from each corner. Find the area left.

Your work:

Problem 24

A trapezium-shaped garden has bases 40 m and 30 m and height 20 m. $\frac{1}{5}$ of it is a pond; vegetables grow on the rest at 3 kg per m^2. Find the harvest.

Your work:

Problem 25

A trapezium-shaped garden has bases 60 m and 40 m and height 30 m. $\frac{1}{3}$ of it is a pond; vegetables grow on the rest at 2 kg per m^2. Find the harvest.

Your work:

Problem 26

An L-shaped plot is a 20 m × 15 m rectangle with a 8 m × 6 m corner removed. Find its area.

Your work:

Problem 27

An L-shaped plot is a 30 m × 24 m rectangle with a 12 m × 10 m corner removed. Find its area.

Your work:

Problem 28

A rectangular garden has perimeter 60 m, and its width is $\frac{2}{3}$ of its length. Find its area.

Your work:

Problem 29

A rectangular garden has perimeter 84 m, and its width is $\frac{3}{4}$ of its length. Find its area.

Your work:

Problem 30

A rectangular garden has perimeter 100 m, and its width is $\frac{1}{4}$ of its length. Find its area.

Your work:

Challenge – Extension

Problem 31 *

A rectangular garden has perimeter 56 m. Adding 4 m to its width and taking 4 m from its length makes it a square. Find its area.

Your work:

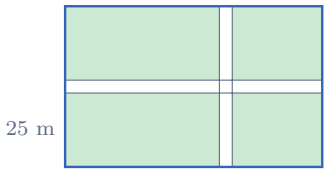

Problem 32 *

Adding 5 m to the length of a rectangular garden adds 60 m^2; taking 3 m from its width removes 75 m^2. Find its area.

Your work:

Problem 33 *

A 40 m by 25 m vegetable garden has two paths 2 m wide crossing at right angles, running the full length and width (see the figure). Find the planted area.

Your work:

Problem 34 *

The two largest possible non-overlapping circles are cut from a 20 cm by 10 cm card. Find the area of card left over.

Your work:

Problem 35 **

Triangle ABC has a right angle at A, $AB = 12$ cm, $AC = 16$ cm and $BC = 20$ cm. Semicircles are drawn outwards on AB, AC and BC. Show that the semicircle on BC has the same area as the other two together.

Your work:

Problem 36 *

A rectangular garden has perimeter 64 m. Adding 5 m to the width and taking 5 m off the length makes it a square. Find its area.

Your work:

Problem 37 *

A rectangular garden has perimeter 80 m. Adding 3 m to the width and taking 3 m off the length makes it a square. Find its area.

Your work:

Problem 38

For a rectangular garden, adding 6 m to the length adds 84 m^2; taking 4 m off the width removes 72 m^2. Find its area.

Your work:

Problem 39

For a rectangular garden, adding 4 m to the length adds 40 m^2; taking 2 m off the width removes 48 m^2. Find its area.

Your work:

Problem 40

A garden is 30 m by 20 m. Two paths 2 m wide cross it, one parallel to each side. Find the area left for planting.

Your work:

Problem 41 *

A garden is 45 m by 32 m. Two paths 3 m wide cross it, one parallel to each side. Find the area left for planting.

Your work:

Problem 42 *

A 25 m by 10 m pool has a paved strip 2 m wide all round. Find the area of the strip.

Your work:

Problem 43 **

Rectangle ABCD has $AB = 12$ cm, $BC = 8$ cm. A semicircle on AB is drawn inside it. Find the area of the rectangle outside the semicircle.

Your work:

Problem 44 *

Square ABCD has side 10 cm. Joining the midpoints of its sides gives square MNPQ. Find its area.

Your work:

Problem 45

A rectangle is cut into four smaller rectangles by one line parallel to each side. Three have areas 12, 18 and 20 cm^2 (12 and 18 side by side on top, 20 below the 12). Find the fourth.

Your work:

Problem 46

A 40 cm by 30 cm picture has a frame 5 cm wide all round. Find the area of the frame.

Your work:

Problem 47

A *flower* shape is a square of side 4 cm with four outward semicircles on its sides. Find its area.

Your work:

Problem 48

A plot has a real area of 4 800 m^2. What is its area in cm^2 on a 1 : 2 000 map?

Your work:

Problem 49 ★

A rectangular garden has perimeter 120 m and its length is twice its width. Vegetables grow on $\frac{3}{4}$ of it at 2 kg per m^2. How much is harvested?

Your work:

Problem 50 ★★

A right-trapezium field has bases 50 m and 30 m. Extending the shorter base by 20 m turns it into a rectangle and adds 400 m^2. Find the original area.

Your work:

Mixed Review – Paper 1

Covers: Chapters 1 – 8 (whole numbers, fractions, decimals, standard word problems, proportion, work problems). **Suggested time:** 60 minutes.

Problem 1

Consider $4,\ 7,\ 10,\ \ldots,\ 301$. **a)** How many terms are there? **b)** Find their sum.

Your work:

Problem 2

Calculate cleverly: $25 \times 37 \times 4 + 63 \times 100$.

Your work:

Problem 3

Compare $\frac{7}{9}$ and $\frac{9}{11}$ without finding a common denominator.

Your work:

Problem 4

Calculate: $\frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \frac{1}{20} + \frac{1}{30}$.

Your work:

Problem 5

Calculate: $2\frac{3}{4} + 1\frac{5}{6}$.

Your work:

Problem 6

Write as decimals: **a)** 3 m 5 cm = ... m; **b)** 2 kg 75 g = ... kg; **c)** 4 t 300 kg = ... t.

Your work:

Problem 7

Moving the decimal point of A one place to the right gives B. If $A + B = 69.3$, find A.

Your work:

Problem 8

Class 5A has 35 pupils, and $\frac{2}{5}$ of them are girls. How many boys are there?

Your work:

Problem 9

$\frac{3}{4}$ of Ha's notebooks is 36. How many notebooks does Ha have?

Your work:

Problem 10

Two numbers add up to 96, and the smaller is $\frac{3}{5}$ of the larger. Find them.

Your work:

Problem 11

A mother is 28 years older than her child, whose age is $\frac{1}{5}$ of hers. Find both ages.

Your work:

Problem 12

A class has girls equal to $\frac{3}{4}$ of the boys. If 2 girls join, the girls are $\frac{5}{6}$ of the boys. How many boys and girls were there at first?

Your work:

Problem 13

8 people build a stretch of dyke in 15 days. How long would 12 people take? (Everyone works at the same rate.)

Your work:

Problem 14

Pipe I fills a tank in 3 hours, pipe II in 6 hours. Starting empty with both open, how long until it is full?

Your work:

Problem 15 ★

Find a whole number that increases by 230 when the digit 5 is written on its right.

Your work:

Problem 16 ★

Tam alone finishes a job in 12 days. Tam and Hung work together for 4 days; then Tam stops, and Hung needs 6 more days to finish. How long would Hung take alone?

Your work:

Mixed Review – Paper 2

Covers: Chapters 9 – 15 (two differences, working backwards, triangles, trapezia, circles, composite area). **Suggested time:** 60 minutes.

Problem 1

Sharing marbles: 3 each leaves 5 over; 5 each is 7 short. Find the number of children and of marbles.

Your work:

Problem 2

Chickens and dogs: 30 heads and 84 legs. How many of each?

Your work:

Problem 3

Find a number such that subtracting 7, multiplying by 3 and adding 12 gives 60.

Your work:

Problem 4

Lan gives her brother half her sweets and 2 more, keeping 8. How many did she have?

Your work:

Problem 5

Find the area of a triangle with base 2.4 dm and height 1.5 dm.

Your work:

Problem 6

A triangle has area 27 cm^2 and base 9 cm. Find its height.

Your work:

Problem 7

Triangle ABC has area 48 cm^2; M is on BC with $BM = \frac{1}{4}BC$. Find the areas of ABM and AMC.

Your work:

Problem 8

Find the area of a trapezium with bases 3.2 m and 2.4 m and height 1.5 m.

Your work:

Problem 9

A trapezium has area 98 cm^2 and height 7 cm; the shorter base is $\frac{3}{4}$ of the longer. Find both bases.

Your work:

Problem 10

Find the circumference and area of a circle of radius 2.5 cm.

Your work:

Problem 11

A circle has circumference 31.4 m. Find its area.

Your work:

Problem 12

A 12 cm by 8 cm card has a round hole of radius 3 cm. Find the area of card left.

Your work:

Problem 13

On a 1 : 2 000 map, a square plot has side 3 cm. Find its real area.

Your work:

Problem 14 ★

A rectangle has perimeter 48 cm, and its length is 3 times its width. Find its area.

Your work:

Problem 15 ⋆

A circle sits inside a square, touching all four sides. The square's area is 64 cm^2. Find the circle's area.

Your work:

Problem 16 ⋆⋆

Seating pupils: with 4 per bench, 3 have no seat; with 5 per bench, 1 bench is empty and the last occupied bench has only 3 pupils. Find the number of benches and pupils.

Your work:

End-of-Book 1 Test

Time: 60 minutes. **Total:** 10 marks. **Questions:** 19.
Part A – 0.4 *mark each.* *Part B* – 0.5 *mark each.* *Part C* – 1 *mark each.*

Part A – Quick answers (4 marks)

Problem 1

Write $\frac{36}{48}$ in its simplest form.

Your work:

Problem 2

Work out mentally: $3.75 \times 10 = \ldots$ and $42.5 : 100 = \ldots$

Your work:

Problem 3

Write $4\frac{7}{8}$ as a fraction.

Your work:

Problem 4

Which is the largest of 4.503, 4.53, 4.5, 4.35?

Your work:

Problem 5

$5\ \text{m}^2\ 8\ \text{dm}^2 = \ldots\ \text{m}^2$.

Your work:

Problem 6

What is $\frac{2}{3}$ of 45?

Your work:

Problem 7

Find a number given that $\frac{2}{5}$ of it is 16.

Your work:

Problem 8

What is the circumference of a circle with diameter 4 cm?

Your work:

Problem 9

What is the area of a triangle with base 6 cm and height 5 cm?

Your work:

Problem 10

What is the area of a trapezium with bases 7 cm and 5 cm and height 4 cm?

Your work:

Part B – Working out (3 marks)

Problem 11

Calculate: $\frac{3}{4} \times \frac{8}{9} : \frac{2}{3}$.

Your work:

Problem 12

Find x: $x - 2\frac{1}{3} = 1\frac{3}{4}$.

Your work:

Problem 13

Two numbers add up to 120 and are in the ratio $\frac{3}{5}$. Find them.

Your work:

Problem 14

6 people finish a job in 10 days. How long would 15 people take? (Same rate.)

Your work:

Problem 15

Pipe I fills a tank in 6 hours, pipe II in 12 hours. Together, starting empty, how long do they take?

Your work:

Problem 16

Find the area of a circle of radius 6 cm.

Your work:

Part C – Problem solving (3 marks)

Problem 17 *

An and Binh have 54 marbles in all. If An gives Binh 6, Binh will have twice as many as An. How many does each have now?

Your work:

Problem 18 *

A shop sells half a roll of cloth and 3 m more, then $\frac{1}{3}$ of what is left, and 20 m remain. How long was the roll?

Your work:

Problem 19 ★★

Rectangle ABCD has $AB = 24$ cm and $AD = 10$ cm; M is the midpoint of CD. **a)** Find the area of triangle ABM. **b)** Find the area of trapezium ABMD.

Your work:
