Review & Test

Mixed Review – Paper 1 231

Mixed Review – Paper 2 237

End-of-Book 2 Test 243

1 Working with Percentages

① Writing a number as a percentage – and back

- The sign % means "out of 100": $1\% = \frac{1}{100} = 0.01$. So $a = a \times 100\%$.
- **Number → percentage:** multiply the number by 100 and write the sign % after it.

  Examples: $3 = 3 \times 100\% = 300\%$; $0.425 = 42.5\%$; $\frac{3}{4} = \frac{3}{4} \times 100\% = 75\%$.
- **Percentage → decimal:** divide by 100 (move the decimal point two places to the left).

  Examples: $36\% = 36 : 100 = 0.36$; $4.5\% = 0.045$; $120\% = 1.2$.
- **Percentage → fraction:** write it as a fraction with denominator 100, then simplify.

  Example: $85\% = \frac{85}{100} = \frac{17}{20}$.

The sign % simply takes the place of "divided by 100".

② Calculating with percentages

- **Adding and subtracting:** add or subtract the numbers and keep the sign %:

  $a\% + b\% = (a + b)\%$; $a\% - b\% = (a - b)\%$.
- **Multiplying or dividing by an ordinary number k:** $a\% \times k = (a \times k)\%$; $a\% : k = (a : k)\%$.
- **Percentage times percentage:** $a\% \times b\% = \frac{a}{100} \times \frac{b}{100}$. Change both to decimals first:

  $30\% \times 40\% = 0.3 \times 0.4 = 0.12 = 12\%$ (*not* 1 200%!).
- **Percentage divided by percentage:** the two signs % cancel and the answer is an ordinary number: $a\% : b\% = a : b$. Example: $45\% : 5\% = 9$.

When in doubt, treat each percentage as a fraction with denominator 100 (or as a decimal) and calculate as usual.

③ Expressions with several kinds of numbers

- An expression may contain decimals, fractions, mixed numbers and percentages together. First change everything into **one kind** of number (all decimals, or all fractions), then follow the usual order of operations: brackets first, then $\times$ and :, then $+$ and $-$.
- To find x, work backwards exactly as with whole numbers, after changing each percentage into a decimal or a fraction.

④ Percentages in word problems

- "A is $a\%$ of B" means $A = \frac{a}{100}$ of B. Simplify the fraction to see the parts:

  "A is 40% of B" $\Rightarrow$ $A = \frac{2}{5}$ of B: A is 2 parts, B is 5 equal parts.
- Then use the familiar methods with a bar model: **sum and ratio**, **difference and ratio**.
- The whole of something is 100%. If parts of it are given as percentages, the part that is left is 100% minus the given percentages.

Example 1

a) Write as percentages: 0.36; $\frac{7}{20}$; 3; 1.075.

b) Write as a decimal and as a fraction in simplest form: 45%; 6.5%; 160%.

Guided solution.

a) $0.36 = 0.36 \times 100\% = 36\%$.

$\frac{7}{20} = \frac{7 \times 5}{20 \times 5} = \frac{35}{100} = 35\%$ or $\frac{7}{20} = 7 : 20 = 0.35 = 35\%$.

$3 = 3 \times 100\% = 300\%$; $1.075 = 107.5\%$.

b) $45\% = 45 : 100 = 0.45$; $45\% = \frac{45}{100} = \frac{9}{20}$.

$6.5\% = 6.5 : 100 = 0.065$; $6.5\% = \frac{65}{1\,000} = \frac{13}{200}$.

$160\% = 1.6$; $160\% = \frac{160}{100} = \frac{8}{5}$.

Example 2

Calculate.

a) $37\% + 48\%$ **b)** $126\% - 58\%$ **c)** $15.5\% \times 6$

d) $40\% \times 15\%$ **e)** $72\% : 9\%$ **g)** $72\% : 9$

Guided solution.

a) *Method 1.* $37\% + 48\% = (37 + 48)\% = 85\%$.

Method 2. $37\% + 48\% = 0.37 + 0.48 = 0.85 = 85\%$.

b) $126\% - 58\% = (126 - 58)\% = 68\%$.

c) $15.5\% \times 6 = (15.5 \times 6)\% = 93\%$.

d) $40\% \times 15\% = 0.4 \times 0.15 = 0.06 = 6\%$.

e) $72\% : 9\% = 0.72 : 0.09 = 8$.

g) $72\% : 9 = (72 : 9)\% = 8\%$.

Be careful: $40\% \times 15\%$ *is* not 600%, *and* $72\% : 9\%$ *is the number* 8, *not* 8%.

Example 3

Calculate: $A = 4.5 - 1\frac{3}{4} + 63\% : 18\%$.

Guided solution.

Method 1 (change to decimals).

$A = 4.5 - 1.75 + 0.63 : 0.18 = 4.5 - 1.75 + 3.5 = 2.75 + 3.5 = 6.25$.

Method 2 (change to fractions).

$$A = \frac{9}{2} - \frac{7}{4} + \frac{63}{100} : \frac{18}{100} = \frac{9}{2} - \frac{7}{4} + \frac{7}{2} = \frac{18}{4} - \frac{7}{4} + \frac{14}{4} = \frac{25}{4} = 6\frac{1}{4}.$$

Both answers $A = 6.25$ *and* $A = 6\frac{1}{4}$ *are correct.*

Example 4

Find x: $x : 25\% + 1.6 = 9 : 0.5$.

Guided solution.

Work out the right-hand side: $9 : 0.5 = 18$.

So $x : 25\% + 1.6 = 18$, hence $x : 25\% = 18 - 1.6 = 16.4$.

Then $x = 16.4 \times 25\% = 16.4 \times 0.25 = 4.1$.

Check: $4.1 : 0.25 + 1.6 = 16.4 + 1.6 = 18$.

Answer: $x = 4.1$.

Example 5

Lan and Hoa have 72 stickers altogether. Hoa's stickers are 80% of Lan's. How many stickers does each girl have?

Guided solution.

$80\% = \frac{80}{100} = \frac{4}{5}$, so Hoa's stickers are $\frac{4}{5}$ of Lan's.

Total number of equal parts: $5 + 4 = 9$.
One part: $72 : 9 = 8$ (stickers).
Lan: $8 \times 5 = 40$ stickers; Hoa: $72 - 40 = 32$ stickers.
Answer: Lan 40 stickers, Hoa 32 stickers.

Practice

Problem 1

Write as percentages.

a) 0.47 **b)** 1.36 **c)** 0.209

d) 0.8 **e)** 2.5 **g)** 0.035

Your work:

Problem 2

Write as percentages.

a) $\frac{3}{5}$ **b)** $\frac{9}{20}$ **c)** $\frac{21}{30}$

d) $\frac{7}{8}$ **e)** $\frac{13}{4}$ **g)** $\frac{33}{40}$

Your work:

Problem 3

Write as decimals.

a) 38%

b) 4%

c) 215%

d) 9.6%

e) 300%

g) 0.5%

Your work:

Problem 4

Write as fractions in simplest form.

a) 40%

b) 85%

c) 64%

d) 150%

e) 2.5%

g) 62.5%

Your work:

Problem 5

Compare (write $>$, $<$ or $=$).

a) 0.7 ... 69%

b) $\frac{3}{8}$ ... 37.5%

c) 125% ... $1\frac{1}{5}$

d) $\frac{2}{3}$ ... 66%

Your work:

Problem 6

Write in order from smallest to largest: 0.43, $\frac{2}{5}$, 41.5%, $\frac{9}{20}$, 39%.

Your work:

Problem 7

Calculate.

a) $28\% + 56\%$

b) $143\% - 67\%$

c) $12.5\% + 7.25\% + 30.25\%$

d) $90\% - 45\% + 15\%$

Your work:

Problem 8

Calculate.

a) $23.4\% \times 5$

b) $252\% : 12$

c) $6.8\% \times 15$

d) $99\% : 4.5$

Your work:

Problem 9

Calculate and write the result as a decimal.

a) $60\% \times 35\%$

b) $140\% \times 25\%$

c) $3.5\% \times 80\%$

d) $84\% : 12\%$

e) $45\% : 0.5\%$

g) $7.2\% : 16\%$

Your work:

Problem 10

Calculate.

a) $2.4 + 35\% - \frac{3}{4}$

b) $1\frac{1}{2} \times 40\% + 2.8 : 70\%$

Your work:

Problem 11

Calculate.

a) $25\% \times 8 + 13.5 : 4.5 - 2\frac{2}{5}$

b) $4.8 - 1\frac{1}{4} + 36\% : 144\%$

Your work:

Problem 12

Calculate in a clever way.

a) $37\% \times 2.5 + 63\% \times 2.5$

b) $125\% \times 4.7 \times 80\%$

c) $6.4 \times 45\% + 6.4 \times 55\%$

Your work:

Problem 13

Find x.

a) $20\% \times x = 1.35 + 0.25$

b) $x : 40\% - 2.5 = 7.5 : 1.5$

Your work:

Problem 14

Find x.

a) $150\% \times x = 4.2 - 1.8$

b) $x : 25\% + 0.75 = 0.75 \times 21$

Your work:

Problem 15

Find x.

a) $x + 35\% \times x = 5.4$

b) $x - 12\% \times x = 22$

Your work:

Problem 16

A tap fills an empty tank. In the first hour it fills 30% of the tank; in the second hour it fills 12% of the tank more than in the first hour. After these two hours, what percentage of the tank is still empty?

Your work:

Problem 17

A school library has three kinds of books: storybooks, science books and textbooks. Storybooks make up 45% of all the books; the number of science books is $\frac{2}{3}$ of the number of storybooks. What percentage of the books are textbooks?

Your work:

Problem 18

This year Khoa's age is 25% of his father's age, and his grandfather's age is 175% of his father's age. Khoa and his father are 50 years old altogether. How old is each of the three people?

Your work:

Problem 19

A rectangle has a perimeter of 32 dm. Its width is 60% of its length. Find the area of the rectangle.

Your work:

Problem 20

A farm has 150 rabbits and chickens in all. After 10 rabbits and 20 chickens are sold, the number of rabbits left is 50% of the number of chickens left. How many rabbits and how many chickens were there at first?

Your work:

Problem 21

Two shelves hold 72 books altogether. If 20% of the books on the first shelf are moved to the second shelf, the two shelves will hold the same number of books. How many books are on each shelf?

Your work:

Problem 22

Two warehouses A and B store rice. If 2 tonnes are moved from A to B, the two warehouses hold equal amounts. If instead 1 tonne is moved from B to A, the rice in A is 300% of the rice in B. How much rice did each warehouse hold at first?

Your work:

Problem 23

At the start of the school year, the number of boys in class 5A was 80% of the number of girls. In the middle of the year, 2 more boys joined the class, and then the number of boys was 90% of the number of girls. How many pupils did class 5A have at the start of the year?

Your work:

Problem 24

A shop had a stock of fabric. On Monday it sold 18.5% of the stock, on Tuesday 26.5%, and on Wednesday as much as on Monday and Tuesday together. What percentage of the stock was left?

Your work:

Problem 25

Find x.

a) $75\% \times x + x \times \frac{1}{4} = 3.6$

b) $x : 20\% - x = 12$

Your work:

Problem 26

Calculate: $(45\% + 0.55) \times 3.7 - 75\% \times 4$.

Your work:

Problem 27

In a school, 60% of the pupils are girls, and 25% of the girls sing in the school choir. What percentage of all the pupils are girls who sing in the choir?

Your work:

Problem 28

The sum of two numbers is 2.7. The first number is 125% of the second. Find the two numbers.

Your work:

Problem 29

The difference between two numbers is 3.6. The smaller number is 40% of the larger number. Find the two numbers.

Your work:

Problem 30

Mum cuts 35% off a ribbon, then cuts 40% of what is left. **a)** What percentage of the ribbon is left? **b)** The piece left is 7.8 m long. How long was the ribbon?

Your work:

Challenge – Extension

Problem 31 *

At a swimming pool, the number of children sitting on the side is 25% of the number of children in the water. Then 4 children from the side jump into the water, and now the number of children on the side is 12.5% of the number in the water. How many children are there in all?

Your work:

Problem 32

An's stamps are 75% of Bình's stamps. If each of them gets 10 more stamps, An's stamps will be 80% of Bình's. How many stamps does each boy have now?

Your work:

Problem 33

The price of a toy was raised by 20%. Later the new price was lowered by 20%. Compared with the original price, did the final price go up or down, and by what percentage?

Your work:

Problem 34 *

The length of a rectangle is increased by 25% and its width is decreased by 20%. How does the area change?

Your work:

Problem 35 *

Three numbers add up to 108. The first number is 50% of the second, and the third is 150% of the second. Find the three numbers.

Your work:

Problem 36 *

Find x: $(x - 15\% \times x) : 1.7 = 30\%$.

Your work:

Problem 37 *

Calculate: $A = 1\% + 2\% + 3\% + \cdots + 98\% + 99\%$. Write the answer as a decimal.

Your work:

Problem 38 *

Calculate in a clever way: $12.5\% \times 0.25 \times 7.9 \times 8 \times 400\%$.

Your work:

Problem 39

A box contains red and blue balls; the red balls are 60% of all the balls. After 20 blue balls are put in, the red balls are 40% of all the balls. How many red balls are in the box?

Your work:

Problem 40

Three taps fill a tank together. Tap A pours in 40% of the tank, tap B pours in 75% of what tap A pours, and tap C pours in the rest. Tap C pours 54 litres less than tap A. How many litres does the tank hold?

Your work:

Problem 41

A shop sold 40% of its rice on the first day and 50% of the remaining rice on the second day; 48 kg were left. How many kilograms of rice did the shop have?

Your work:

Problem 42

Find x: $x \times 125\% + x : 4 + x \times 0.5 = 3.4$.

Your work:

Problem 43

This year a daughter's age is 25% of her mother's age. In 6 years' time, the daughter's age will be $\frac{1}{3}$ of her mother's age. How old is each of them now?

Your work:

Problem 44

A jug holds 200 g of salt water in which salt makes up 5%. How many grams of pure water must be added so that salt makes up 4%?

Your work:

Problem 45

Number A is 25% more than number B. By what percentage is B smaller than A?

Your work:

Problem 46

In a class, 45% of the pupils are boys, and there are 6 more girls than boys. How many pupils are in the class?

Your work:

Problem 47

Fresh mushrooms contain 92% water. After drying, the mushrooms contain 20% water. How many kilograms of dried mushrooms do we get from 100 kg of fresh mushrooms?

Your work:

Problem 48

The sum of two numbers is 168; 40% of the first number equals 30% of the second number. Find the two numbers.

Your work:

Problem 49

A number is decreased by 25%. By what percentage must the new number be increased to get back to the original number?

Your work:

Problem 50

An, Bình and Chi share the cost of a present. An pays 30% of the cost; Bình pays 40% of the remaining amount; Chi pays the rest. Chi pays 14 000 dong more than Bình. How much does each person pay?

Your work:

2 Percentage Word Problems

① Finding the percentage one number is of another

- To find what percentage A is of B: divide A by B, then write the quotient as a percentage (multiply by 100 and write %).

  Example: 9 is what percentage of 12? $9 : 12 = 0.75 = 75\%$.

- Read the question carefully: "A compared with B" means B is the whole (100%) and we divide by B.
- **Above or below plan:** if the plan is 100%, then actual : plan tells what percentage of the plan was done; the part above 100% is the percentage *exceeding* the plan.
- **Percentage increase or decrease:** (change) : (old amount), written as a percentage.

② Finding a percentage of a number

- To find $a\%$ of M, calculate $M \times a : 100$ or $M : 100 \times a$.

  Example: 15% of 60 kg is $60 \times 15 : 100 = 9$ (kg).

- $M : 100$ is 1% of M; multiplying by a gives $a\%$ of M. This "go to 1% first" idea also helps to work backwards: if $a\%$ of a number is N, then 1% of it is $N : a$ and the number is $N : a \times 100$.

③ Percentages in everyday life

- **Discount:** a price cut of $a\%$ means we pay $(100 - a)\%$ of the old price.
- **Profit:** profit = selling price − cost price. "Profit of 20%" usually means 20% of the cost price, so the selling price is 120% of the cost price.
- **Savings interest:** with an interest rate of 0.5% a month, each month the bank adds 0.5% of the money in the account.
- **Salt water:** "5% salt" means the salt weighs 5% of the whole salt water.

Always ask: "percentage of what*?" – that quantity is the* 100%.

Example 1

Find the percentage: **a)** of 0.6 compared with 2.4; **b)** of 7 compared with 4.

Guided solution.

a) $0.6 : 2.4 = 0.25 = 25\%$.

b) $7 : 4 = 1.75 = 175\%$.

Answer: a) 25%; **b)** 175%.

Example 2

Class 5B has 18 boys and 22 girls. What percentage of the class are boys? What percentage are girls?

Guided solution.

Pupils in the class: $18 + 22 = 40$.

Boys compared with the whole class: $18 : 40 = 0.45 = 45\%$.

Girls compared with the whole class:

Method 1. $22 : 40 = 0.55 = 55\%$. *Method 2.* $100\% - 45\% = 55\%$.

Answer: boys 45%, girls 55%.

Example 3

Find 35% of 240.

Guided solution.

Method 1. $240 : 100 \times 35 = 2.4 \times 35 = 84$.

Method 2. $240 \times 35 : 100 = 8\,400 : 100 = 84$.

Answer: 84.

Example 4

A youth group planned to plant 250 trees, but actually planted 290 trees. What percentage of the plan did they reach, and by what percentage did they exceed the plan?

Guided solution.

Actual compared with plan: $290 : 250 = 1.16 = 116\%$.

They exceeded the plan by: $116\% - 100\% = 16\%$.

Answer: 116% of the plan; exceeded by 16%.

Example 5

A school bag costs 180 000 dong. During a sale its price is cut by 15%. How much does the bag cost in the sale?

Guided solution.

Method 1. The price cut: $180\,000 \times 15 : 100 = 27\,000$ (dong).

Sale price: $180\,000 - 27\,000 = 153\,000$ (dong).

Method 2. We pay $100\% - 15\% = 85\%$ of the price: $180\,000 \times 85 : 100 = 153\,000$ (dong).

Answer: 153 000 dong.

Practice

Problem 1

Find the percentage of the first number compared with the second.

a) 18 and 24 **b)** 4.5 and 12.5 **c)** 0.9 and 3.6

d) 27 and 15 **e)** 3.4 and 8 **g)** $\frac{1}{4}$ and 5

Your work:

Problem 2

Calculate.

a) 15% of 60 kg **b)** 8% of 450 m **c)** 25% of 7.2 l

d) 40% of 3.5 tonnes **e)** 120% of 85 cm **g)** 12.5% of 96 m^2

Your work:

Problem 3

A bag holds 48 marbles: 30 are red and the rest are green. **a)** What percentage of the marbles are red? **b)** What is the percentage of green marbles compared with red marbles?

Your work:

Problem 4

In a maths test, 34 of the 40 pupils of class 5C got a good mark. What percentage of the class got a good mark?

Your work:

Problem 5

A bicycle workshop planned to make 400 bicycles in a month, but it made 460. What percentage of the plan did it reach? By what percentage did it exceed the plan?

Your work:

Problem 6

A village planned to plant 1 250 trees this year. By the end of March it had planted 1 000 trees. What percentage of the plan has been done, and what percentage is still to do?

Your work:

Problem 7

Aunt Lan earns 12 million dong a month and saves 2.7 million dong of it. What percentage of her pay does she save?

Your work:

Problem 8

Last year Minh weighed 38 kg. This year his weight has gone up by 10% of last year's weight. How much does Minh weigh now?

Your work:

Problem 9

A rectangular plot of land is 50 m long; its width is 60% of its length. Vegetables are grown on 45% of its area, flowers on 35%, and the rest is paths. Find the area of the paths.

Your work:

Problem 10

A shop sold 1 200 kg of rice, of which 35% was sticky rice. How many kilograms of ordinary rice did it sell?

Your work:

Problem 11

A school has 640 pupils, and 55% of them are girls. How many boys are there?

Your work:

Problem 12

A shopkeeper buys a shirt for 150 000 dong and sells it for 180 000 dong. Her profit is what percentage of the cost price?

Your work:

Problem 13

A storybook costs 60 000 dong. At the book fair it is sold at a 10% discount. How much does it cost at the fair?

Your work:

Problem 14

Mrs Hạnh puts 20 000 000 dong into a savings account with interest of 0.6% a month. After one month, how much interest does she get, and how much money is in the account?

Your work:

Problem 15

Seawater contains 3.5% salt. How many kilograms of salt are there in 40 kg of seawater?

Your work:

Problem 16

The price of a notebook went up from 8 000 dong to 9 000 dong. By what percentage did the price go up?

Your work:

Problem 17

The price of a pair of trainers went down from 250 000 dong to 200 000 dong. By what percentage did the price go down?

Your work:

Problem 18

A football team played 25 matches: it won 16, drew 4 and lost the rest. What percentage of the matches did it win, draw and lose?

Your work:

Problem 19

Hoa is reading a 240-page book. On the first day she reads 30% of the book, on the second day 45%. How many pages are left?

Your work:

Problem 20

A farmer planted 450 young trees; 18 of them died. What percentage of the trees survived?

Your work:

Problem 21

Out of 500 bean seeds, 92% sprouted. How many seeds did not sprout?

Your work:

Problem 22

Class 5A has 35 pupils; 40% of them got an excellent report. How many pupils did not get an excellent report?

Your work:

Problem 23

A basket holds 80 apples and pears; the pears make up 40%. Find the percentage of apples compared with pears.

Your work:

Problem 24

For a tree-planting day, 32 of the 40 pupils of class 5A and 27 of the 30 pupils of class 5B took part. Which class took part at the higher rate?

Your work:

Problem 25

Last year a factory made 2 400 products. This year it made 15% more. How many products did it make this year?

Your work:

Problem 26

A museum ticket costs 40 000 dong. Children get a 25% discount. How much does a family of 2 adults and 3 children pay?

Your work:

Problem 27

A rectangular garden is 25 m long and 16 m wide. The length is increased by 20% and the width stays the same. Find the new area. By what percentage did the area increase?

Your work:

Problem 28

Fresh milk contains 4% fat. How many grams of fat are there in 3 kg of fresh milk?

Your work:

Your work:

Problem 50 ★★

In a maths contest, 60% of the pupils come from the city and the rest from the countryside. 25% of the city pupils and 40% of the countryside pupils win a prize. What percentage of all the pupils win a prize?

Your work:

3 Cuboids and Cubes

① Cuboids

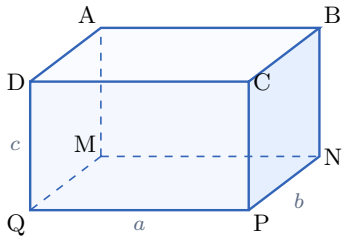

A matchbox, a brick and a shoebox all have the shape of a **cuboid** (a rectangular box).

Cuboid ABCD.MNPQ has:

- 6 **faces**, all rectangles; opposite faces are equal. ABCD and MNPQ are the two **bases**; the other four faces are the **side faces**;
- 12 **edges**, in three groups of 4 equal edges;
- 8 **vertices**: A, B, C, D, M, N, P, Q.

The three **dimensions** are the **length** a, the **width** b (the two sides of the base) and the **height** c (a side edge such as DQ).

In a drawing, edges we cannot see are drawn *dashed*.

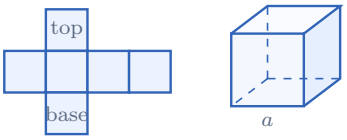

② Cubes and nets

A **cube** is a cuboid whose 12 edges are all equal. Its 6 faces are equal squares.

If we cut a box along some edges and unfold it flat, we get a **net** of the box. A net of a cube is made of 6 equal squares; the figure on the right is one of them. Folding the net back up gives the cube again.

Not every set of 6 joined squares is a net: two squares must never land on the same face when we fold.

③ Lateral area and total surface area

The **lateral area** S_{lat} of a cuboid is the total area of its 4 side faces. Unfolded, the four side faces make one long rectangle whose length is the **perimeter of the base** and whose width is the **height**:

$$S_{\text{lat}} = (a + b) \times 2 \times c \qquad \text{(perimeter of base} \times \text{height)}$$

The **total surface area** S_{tot} is the lateral area plus the areas of the two bases:

$$S_{\text{tot}} = S_{\text{lat}} + a \times b \times 2$$

For a **cube** with edge a: $S_{\text{lat}} = a \times a \times 4$, $S_{\text{tot}} = a \times a \times 6$.

Remember: all dimensions must be in the same unit. A box *without a lid* has only one base: its area is $S_{\text{lat}} + a \times b$.

Example 1

A cuboid is 8 cm long, 5 cm wide and 6 cm high. Find:

a) its lateral area; **b)** the area of one base; **c)** its total surface area.

Guided solution.

a) Perimeter of the base: $(8 + 5) \times 2 = 26$ cm.

$S_{\text{lat}} = 26 \times 6 = 156$ cm^2.

b) Area of one base: $8 \times 5 = 40$ cm^2.

c) $S_{\text{tot}} = 156 + 40 \times 2 = 236$ cm^2.

Answer: a) 156 cm^2; **b)** 40 cm^2; **c)** 236 cm^2.

Example 2

A cube has a total surface area of 294 cm^2. Find its edge and its lateral area.

Guided solution.

A cube has 6 equal faces. Area of one face: $294 : 6 = 49$ cm^2.

Since $49 = 7 \times 7$, the edge is 7 cm.

Lateral area: $49 \times 4 = 196$ cm^2.

Answer: Edge 7 cm; 196 cm^2.

Example 3

A cuboid has a base of area 60 cm^2. Its length is 3 times its height and is 8 cm more than its height. Find its lateral area and total surface area.

Guided solution.

The length is 3 times the height, so the difference is $3 - 1 = 2$ times the height.

Height: $8 : 2 = 4$ cm. Length: $4 \times 3 = 12$ cm. Width: $60 : 12 = 5$ cm.

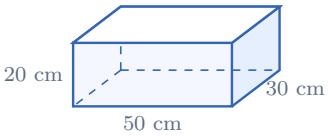

$S_{\text{lat}} = (12 + 5) \times 2 \times 4 = 136$ cm^2.

$S_{\text{tot}} = 136 + 60 \times 2 = 256$ cm^2.

Answer: 136 cm^2; 256 cm^2.

Example 4

A tin box *without a lid* is 50 cm long, 30 cm wide and 20 cm high. How much tin is needed to make it? (Ignore the seams.)

Guided solution.

The box has 4 side faces and only 1 base.

Lateral area: $(50 + 30) \times 2 \times 20 = 3\,200$ cm^2.

Base: $50 \times 30 = 1\,500$ cm^2.

Tin needed: $3\,200 + 1\,500 = 4\,700$ cm^2.

Answer: $4\,700$ cm^2.

Example 5

A room is 6 m long, 4.5 m wide and 3.5 m high. The four walls and the ceiling are to be painted. The doors and windows have a total area of 7.5 m^2. Find the area to be painted.

Guided solution.

Four walls (lateral area): $(6 + 4.5) \times 2 \times 3.5 = 73.5$ m^2.

Ceiling: $6 \times 4.5 = 27$ m^2.

Area to paint: $73.5 + 27 - 7.5 = 93$ m^2.

The floor is not painted, and the doors and windows are taken away.

Answer: 93 m^2.

Practice

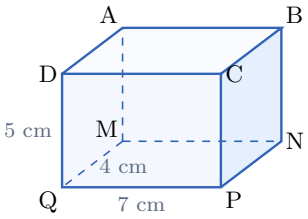

Problem 1

Cuboid ABCD.MNPQ has $QP = 7$ cm, $QM = 4$ cm and $QD = 5$ cm.

a) Find the lengths of the edges AB, BN and NP.

b) Find the areas of the base MNPQ and of the faces DCPQ and ADQM.

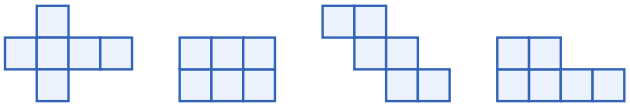

c) Find its lateral area and total surface area.

Your work:

Problem 2

Which of the figures below are nets of a cube?

a) **b)** **c)** **d)**

Your work:

Problem 3

Find the lateral area and the total surface area of a cuboid with:

a) $a = 9$ cm, $b = 6$ cm, $c = 5$ cm;

b) $a = 2.5$ m, $b = 1.5$ m, $c = 1.2$ m;

c) $a = \frac{4}{5}$ m, $b = \frac{1}{2}$ m, $c = \frac{1}{3}$ m;

d) $a = 1.2$ dm, $b = 8$ cm, $c = 5$ cm.

Your work:

Problem 4

Find the lateral area and the total surface area of a cube with edge:

a) 6 cm; **b)** 2.5 dm; **c)** $\frac{3}{4}$ m.

Your work:

Problem 5

A cuboid is 15 cm long, 10 cm wide and 8 cm high. Find:

a) the perimeter of its base; **b)** its lateral area; **c)** its total surface area.

Your work:

Problem 6

Mai wraps a gift box 24 cm long, 16 cm wide and 10 cm high, covering every face. What is the least area of wrapping paper she needs?

Your work:

Problem 7

A box is 40 cm long, 25 cm wide and 20 cm high. Lan covers its four side faces with blue paper and its two bases with yellow paper (outside only). Which colour of paper is used more, and by how many square centimetres?

Your work:

Problem 8

An iron box without a lid is 60 cm long, 40 cm wide and 30 cm high. How much iron sheet is used to make it? (Ignore the seams.)

Your work:

Problem 9

A classroom is 8 m long, 6 m wide and 3.5 m high. The four walls and the ceiling are to be painted; the doors and windows cover 9.5 m^2. Find the area to be painted.

Your work:

Problem 10

A water tank in the shape of a cube without a lid has edge 1.5 m. Its outside (side faces and bottom) is painted. Find the painted area.

Your work:

Problem 11

A cube has a lateral area of 100 cm^2. Find its edge and its total surface area.

Your work:

Problem 12

A cube has a total surface area of 600 cm^2. Find its lateral area.

Your work:

Problem 13

A cube has a lateral area of 1.44 m^2. Find its edge and its total surface area.

Your work:

Problem 14

A cuboid has a lateral area of 360 cm^2 and a height of 9 cm. Its length is 4 cm more than its width. Find the length and the width.

Your work:

Problem 15

A cuboid has a base perimeter of 36 dm and a height of 7 dm. Find its lateral area.

Your work:

Problem 16

A cuboid has a lateral area of 480 cm^2 and a base perimeter of 48 cm. Find its height.

Your work:

Problem 17

A cuboid is 2.4 m long and 1.6 m wide, and its total surface area is 19.68 m^2. Find its height.

Your work:

Problem 18

A wooden crate is 1.2 m long, 0.8 m wide and 0.6 m high. All of its outside faces are varnished, using 0.25 kg of varnish per square metre. How many kilograms of varnish are needed?

Your work:

Problem 19

A swimming pool is 25 m long, 10 m wide and 1.6 m deep. Its bottom and its four walls are covered with tiles measuring 25 cm by 20 cm. How many tiles are needed? (Ignore the joints.)

Your work:

Problem 20

A fish pond is 3 m long, 2 m wide and 0.8 m deep. Its bottom and walls are covered with square tiles of side 2 dm. How many tiles are needed?

Your work:

Problem 21

A cuboid has a base perimeter of 30 cm; its length is 3 cm more than its width, and its height is $\frac{2}{3}$ of its length. Find its lateral area and total surface area.

Your work:

Problem 22

Compare the total surface area of a cube with edge 6 cm and that of a cuboid 8 cm long, 6 cm wide and 4 cm high.

Your work:

Problem 23

A cuboid has a square base of side 5 cm and a height of 12 cm. Find its lateral area and total surface area.

Your work:

Problem 24

A lantern has a frame in the shape of a cuboid with a square base of side 20 cm and a height of 35 cm. Paper is glued on the four sides and the bottom. How many square decimetres of paper are used?

Your work:

Problem 25

A piece of cardboard is just enough to make a cube-shaped box without a lid, with edge 2.5 dm. Find the area of the cardboard. (Ignore the flaps.)

Your work:

Problem 26

A cube-shaped tank without a lid has a base perimeter of 4.8 m. Both its inside and its outside are painted, and 1 kg of paint covers 3 m^2. How many kilograms of paint are needed?

Your work:

Problem 27

The 12 edges of a cuboid add up to 96 cm. Its length is 12 cm and its width is 8 cm. Find its total surface area.

Your work:

Problem 28

The 12 edges of a cube add up to 72 cm. Find its total surface area.

Your work:

Problem 29

A glass aquarium without a lid is 80 cm long, 40 cm wide and 50 cm high. How many square decimetres of glass are used?

Your work:

Problem 30

The total surface area of a cube is 50 cm^2 more than its lateral area. Find its lateral area.

Your work:

Challenge – Extension

Problem 31

A cuboid has a base of area 120 cm^2. Its length is 9 cm more than its height, and its height is $\frac{2}{5}$ of its length. Find its lateral area and total surface area.

Your work:

Problem 32

A water tank has a lateral area of 10.5 m^2 and a height of 1.5 m. Its length is 1 m more than its width. Find its length and width.

Your work:

Problem 33

An iron crate in the shape of a cuboid has a width equal to $\frac{3}{4}$ of its length and 0.5 m less than its length; its height is 1.2 m.

a) Find its total surface area.

b) The outside is painted completely, using 3 kg of paint for every 4 m^2. How many kilograms of paint are needed?

Your work:

Problem 34 ★★

If the edge of a cube is increased by 2 cm, its total surface area increases by 120 cm^2. Find the original edge.

Your work:

Problem 35 ★

Two cubes, each with edge 5 cm, are glued face to face to make a cuboid. Find the total surface area of the cuboid. How much less is it than the total of the two cubes' surface areas?

Your work:

Problem 36 ★

Three cubes with edge 4 cm are put in a row and glued into a cuboid. Find the total surface area of that cuboid.

Your work:

Problem 37 *

A cuboid 10 cm long, 6 cm wide and 4 cm high is cut into two equal halves by a cut parallel to its base. Find the total surface area of the original cuboid and the total surface area of the two halves together.

Your work:

Problem 38 *

A cuboid has a square base and a lateral area of 160 cm^2. Its height is 2.5 times the side of the base. Find its total surface area.

Your work:

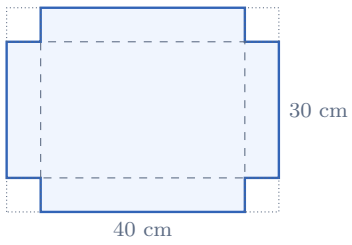

Problem 39 *

A cube has a total surface area of 1.5 m^2. Find its edge and its lateral area.

Your work:

Problem 40 **

From a rectangular sheet of card 40 cm by 30 cm, Nam cuts a square of side 5 cm from each corner and folds up the sides to make an open box. Find the length, width and height of the box and the area of card it uses.

Your work:

Problem 41 *

A room is 5 m long, 4 m wide and 3 m high. The inside walls and the ceiling are painted. The door and windows cover 4 m^2. Painting costs 25 000 đồng per square metre. Find the cost.

Your work:

Problem 42 *

The 12 edges of a cuboid add up to 120 cm. Its length is 3 times its width and its height is 2 times its width. Find its total surface area.

Your work:

Problem 43 **

Three different faces of a cuboid have areas 12 cm^2, 15 cm^2 and 20 cm^2. Find its total surface area, and find its three dimensions (whole numbers of centimetres).

Your work:

Problem 44 *

A cube-shaped box without a lid has edge 15 cm. Coloured paper is glued on both the inside and the outside. Find the area of paper used.

Your work:

Problem 45 *

A cuboid has a square base of side 6 cm. Its lateral area is 3 times the total area of its two bases. Find its height and total surface area.

Your work:

Problem 46 *

Two identical cuboids, each 8 cm $\times$ 5 cm $\times$ 3 cm, are glued together along their largest faces. Find the total surface area of the new cuboid.

Your work:

Problem 47 **

A pool is 12.5 m long, 6 m wide and 1.4 m deep. Its bottom and walls are tiled with tiles of 25 cm $\times$ 20 cm. Tiles are sold in boxes of 12. How many boxes must be bought?

Your work:

Problem 48 *

A cube has the same total surface area as a cuboid 12 cm long, 9 cm wide and 4 cm high. Find the edge of the cube.

Your work:

Problem 49 **

A cuboid is 5 cm high. If its length is decreased by 3 cm and its width increased by 3 cm, its base becomes a square of side 8 cm. Compare the total surface areas of the old and the new cuboid.

Your work:

Problem 50 **

A cube of edge 6 cm is cut into 8 equal small cubes. Find the total surface area of the 8 small cubes and compare it with that of the big cube.

Your work:

4 Volume

① Volume and units of volume

The **volume** of a solid is the amount of space it takes up. To measure volume we count how many *unit cubes* fit into the solid.

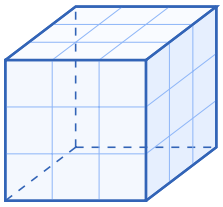

A **cubic centimetre** (cm^3) is the volume of a cube with edge 1 cm. Likewise, 1 dm^3 is a cube with edge 1 dm and 1 m^3 is a cube with edge 1 m.

$$1\ m^3 = 1\,000\ dm^3 \qquad 1\ dm^3 = 1\,000\ cm^3$$

Each unit of volume is 1 000 times the next smaller unit, so when converting we move the decimal point **three** places.

For liquids:

$$1\ l = 1\ dm^3 \qquad 1\ ml = 1\ cm^3 \qquad 1\ m^3 = 1\,000\ l$$

1 dm^3: 10 layers of 10×10 cubes = 1 000 cm^3 (drawn coarser)

② Volume of a cuboid and of a cube

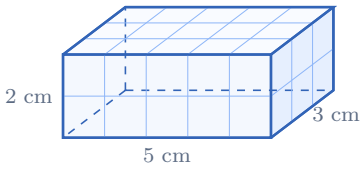

A cuboid 5 cm long, 3 cm wide and 2 cm high holds 2 layers of $5 \times 3 = 15$ unit cubes, i.e. $5 \times 3 \times 2 = 30\ cm^3$.

The **volume of a cuboid** is length × width × height (same unit):

$$V = a \times b \times c = S_{\text{base}} \times c$$

The **volume of a cube** with edge a: $V = a \times a \times a$.

Working backwards: $c = V : (a \times b)$, $S_{\text{base}} = V : c$.

③ Volume of an object in water

A stone or a piece of coral has no simple shape, so we cannot use a formula for it. Put it into a tank of water so that it is **completely under water**: the water rises because the stone takes up space.

- *Method 1:* volume of the stone = volume of (water + stone) − volume of the water.

- *Method 2:* volume of the stone = base area of the tank × the rise in water level.

If the tank is already full, the volume of water that **overflows** equals the volume of the object.

Example 1

Fill in the blanks.

a) $3.5\ \text{m}^3 = \ldots\ \text{dm}^3$

b) $2\,400\ \text{cm}^3 = \ldots\ \text{dm}^3$

c) $0.75\ \text{dm}^3 = \ldots\ \text{cm}^3 = \ldots\ \text{ml}$

d) $1.2\ \text{m}^3 = \ldots\ \text{l}$

Guided solution.

a) $1\ \text{m}^3 = 1\,000\ \text{dm}^3$, so $3.5\ \text{m}^3 = 3.5 \times 1\,000 = 3\,500\ \text{dm}^3$.

b) $2\,400\ \text{cm}^3 = 2\,400 : 1\,000 = 2.4\ \text{dm}^3$.

c) $0.75\ \text{dm}^3 = 750\ \text{cm}^3 = 750\ \text{ml}$.

d) $1.2\ \text{m}^3 = 1\,200\ \text{dm}^3 = 1\,200\ \text{l}$.

Answer: a) 3 500; **b)** 2.4; **c)** 750, 750; **d)** 1 200.

Example 2

Find the volume of:

a) a cuboid 1.2 m long, 5 dm wide and 8 dm high;

b) a cube with edge 2.5 cm.

Guided solution.

a) Change to the same unit: 1.2 m = 12 dm.

$V = 12 \times 5 \times 8 = 480\ \text{dm}^3$.

b) $V = 2.5 \times 2.5 \times 2.5 = 15.625\ \text{cm}^3$.

Answer: a) $480\ \text{dm}^3$; **b)** $15.625\ \text{cm}^3$.

Example 3

A water tank is 1.5 m long, 0.8 m wide and 1 m high.

a) How many litres does it hold when full?

b) At the moment the tank is $\frac{3}{4}$ full. How many litres of water are in it?

Guided solution.

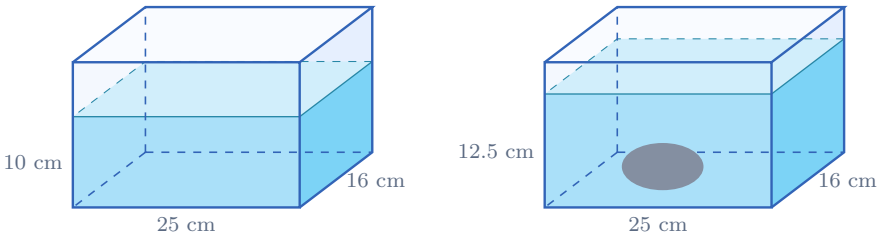

a) $V = 1.5 \times 0.8 \times 1 = 1.2\ \text{m}^3 = 1\,200\ \text{dm}^3 = 1\,200\ \text{l}$.

b) $1\,200 \times \frac{3}{4} = 900\ \text{l}$.

Answer: a) 1 200 l; **b)** 900 l.

Example 4

A glass tank has a base 25 cm long and 16 cm wide. The water is 10 cm deep. After a stone is dropped in (and is completely under water), the water is 12.5 cm deep. Find the volume of the stone.

Guided solution.

Method 1. Water: $25 \times 16 \times 10 = 4\,000$ cm^3.

Water and stone: $25 \times 16 \times 12.5 = 5\,000$ cm^3.

Stone: $5\,000 - 4\,000 = 1\,000$ cm^3.

Method 2. The water rises $12.5 - 10 = 2.5$ cm.

Stone: $25 \times 16 \times 2.5 = 1\,000$ cm^3.

Answer: $1\,000$ cm^3 $(= 1$ dm$^3)$.

Example 5

A cube has a total surface area of 864 cm^2. Find its volume.

Guided solution.

One face: $864 : 6 = 144$ cm^2. Since $144 = 12 \times 12$, the edge is 12 cm.

$V = 12 \times 12 \times 12 = 1\,728$ cm^3.

Answer: $1\,728$ cm^3.

Practice

Problem 1

Fill in the blanks.

a) 5 m$^3 = \ldots$ dm^3

b) 3.2 dm$^3 = \ldots$ cm^3

c) $4\,500$ cm$^3 = \ldots$ dm^3

d) 750 dm$^3 = \ldots$ m^3

e) 2.05 m$^3 = \ldots$ dm^3

f) $\frac{1}{4}$ m$^3 = \ldots$ dm^3

Your work:

Problem 2

Fill in the blanks.

a) $3.6\ \text{m}^3 = \ldots\ \text{l}$

b) $450\ \text{l} = \ldots\ \text{m}^3$

c) $2.5\ \text{l} = \ldots\ \text{cm}^3$

d) $750\ \text{ml} = \ldots\ \text{dm}^3$

Your work:

Problem 3

Compare (write $>$, $<$ or $=$).

a) $2.5\ \text{m}^3 \ \ldots\ 2\,500\ \text{dm}^3$ **b)** $3\ \text{dm}^3\ 40\ \text{cm}^3 \ \ldots\ 3.4\ \text{dm}^3$ **c)** $0.9\ \text{m}^3 \ \ldots\ 90\,000\ \text{cm}^3$

Your work:

Problem 4

Find the volume of a cuboid with length a, width b and height c:

a) $a = 8$ cm, $b = 5$ cm, $c = 4$ cm;

b) $a = 1.5$ m, $b = 0.8$ m, $c = 1.2$ m;

c) $a = \frac{2}{3}$ m, $b = \frac{3}{5}$ m, $c = \frac{1}{2}$ m;

d) $a = 2$ dm, $b = 15$ cm, $c = 8$ cm.

Your work:

Problem 5

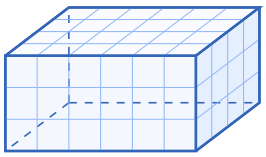

Find the volume of a cube with edge:

a) 7 cm; **b)** 1.2 m; **c)** $\frac{3}{4}$ dm.

Your work:

Problem 6

The box on the right is built from cubes of edge 1 cm, with no gaps. How many small cubes are there? What is the volume of the box?

Your work:

Problem 7

A cuboid has a volume of 360 cm^3, a length of 9 cm and a width of 8 cm. Find its height.

Your work:

Problem 8

A cuboid has a volume of 1.8 m^3 and a base area of 1.2 m^2. Find its height.

Your work:

Problem 9

A cube has a volume of 512 cm^3. Find its edge.

Your work:

Problem 10

A water tank is 2 m long, 1.5 m wide and 1.2 m high. How many litres of water does it hold when full?

Your work:

Problem 11

An aquarium is 60 cm long, 30 cm wide and 40 cm high. The water reaches $\frac{3}{4}$ of its height. How many litres of water are in it?

Your work:

Problem 12

A tank is 1.2 m long, 0.9 m wide and 1 m high. The water in it fills 60% of the tank. How many litres of water are in the tank?

Your work:

Problem 13

A tank has a base 40 cm long and 25 cm wide. When a stone is put in, completely under water, the water rises by 3 cm. Find the volume of the stone in cubic decimetres.

Your work:

Problem 14

A cube-shaped glass tank has edge 5 dm; the water in it is 3 dm deep. After a stone is put in (completely under water), the water is 3.4 dm deep. Find the volume of the stone.

Your work:

Problem 15

A tank has a base 50 cm long and 30 cm wide; the water is 20 cm deep. A stone of volume 1.8 dm^3 is put in and is completely under water. How deep is the water now?

Your work:

Problem 16

A metal block in the shape of a cube has edge $\frac{1}{5}$ m. Each cubic centimetre of the metal weighs 7.8 g. How many kilograms does the block weigh?

Your work:

Problem 17

A cuboid is 10 cm long, 8 cm wide and 6 cm high. A cube has an edge equal to the average of the three dimensions of the cuboid. Which has the larger volume, and by how much?

Your work:

Problem 18

The edge of cube B is 2 times the edge of cube A. How many times the volume of cube A is the volume of cube B?

Your work:

Problem 19

An empty tank is 1.6 m long, 1 m wide and 1.2 m high. A tap pours in 40 l of water per minute. How long does it take to fill the tank?

Your work:

Problem 20

A full water tank is 3 m long, 2 m wide and 1.5 m high. A family uses 1 800 l of water a day. How many days does the water last?

Your work:

Problem 21

Each brick is 20 cm long, 10 cm wide and 5 cm high. Bricks are stacked tightly into a block 2 m long, 1 m wide and 0.5 m high. How many bricks are in the block?

Your work:

Problem 22

A carton is 20 cm long, 12 cm wide and 8 cm high. Small boxes of chalk, each 4 cm $\times$ 3 cm $\times$ 2 cm, are packed into it to fill it exactly. How many boxes of chalk fit?

Your work:

Problem 23

A cuboid has a lateral area of 480 cm^2 and a height of 8 cm; its length is 6 cm more than its width. Find its volume.

Your work:

Problem 24

A tank has a base perimeter of 26 dm and a height of 4 dm. Its length is 3 dm more than its width. How many litres does it hold?

Your work:

Problem 25

A cube-shaped glass tank has edge 8 dm; the water is 5 dm deep. After a piece of coral is put in (completely under water), the water is 5.5 dm deep. Find the volume of the coral.

Your work:

Problem 26

A tank is 2.5 m long, 1.6 m wide and 1.2 m high. The water in it is 0.8 m deep.

a) How many litres of water are in the tank?

b) How many more litres are needed to fill it?

Your work:

Problem 27

A tank is 2 m long, 1.5 m wide and 1.4 m high. The water now fills 30% of the tank. How many litres must be added so that the water fills 80% of the tank?

Your work:

Problem 28

A fish tank has a base 50 cm long and 40 cm wide. Four identical stones are put in, completely under water, and the water rises by 1.5 cm. Find the volume of one stone.

Your work:

Problem 29

A tank is full of water. Three identical iron cubes are lowered into it and 24 l of water overflow. Find the edge of one iron cube.

Your work:

Problem 30

A milk carton is 6 cm long, 4 cm wide and 10 cm high and is filled exactly. How many such cartons can be filled from 4.8 l of milk?

Your work:

Challenge – Extension

Problem 31 *

A fish tank is 60 cm long, 40 cm wide and 45 cm high. At first the water reaches $\frac{3}{5}$ of the height. After a stone is put in (completely under water), the water reaches $\frac{2}{3}$ of the height. Find the volume of the stone.

Your work:

Problem 32 *

A glass fish tank without a lid is 80 cm long, 50 cm wide and 50 cm high; the water is 30 cm deep.

a) Find the area of glass used to make the tank.

b) A stone of volume 16 dm^3 is put in, completely under water. How deep is the water now?

Your work:

Problem 33 **

A tank is 60 cm long, 40 cm wide and 50 cm high; the water is 45 cm deep. A stone of volume 15 dm^3 is lowered into it. How many litres of water overflow?

Your work:

Problem 34 *

Tank A is 1.5 m long, 1 m wide and 0.8 m high and is full of water. All of its water is poured into empty tank B, whose base is 2 m long and 1.2 m wide. How deep is the water in tank B?

Your work:

Problem 35 *

The total surface area of a cube is 72 cm^2 more than its lateral area. Find its volume.

Your work:

Problem 36 *

A cuboid has a volume of 120 cm^3. Its length is doubled, its width is tripled and its height is halved. Find the new volume.

Your work:

Problem 37 ⋆⋆

The edge of a 10 cm cube is increased by 20%. By how many cubic centimetres, and by what percentage, does its volume increase?

Your work:

Problem 38 ⋆⋆

Three different faces of a cuboid have areas 24 cm^2, 30 cm^2 and 20 cm^2, and its edges are whole numbers of centimetres. Find its volume.

Your work:

Problem 39 ⋆⋆

A cuboid's length is 3 times its height and its width is 2 times its height. Its volume is 384 cm^3. Find its dimensions.

Your work:

Problem 40 ⋆⋆

An empty tank is 1.5 m long, 1.2 m wide and 1 m high. Tap A pours in 30 l per minute while tap B lets out 12 l per minute. Both are opened at the same time. How long does it take to fill the tank?

Your work:

Problem 41 *

A swimming pool is 20 m long and 10 m wide. A pump puts in 60 m^3 of water per hour. How long does it take to fill the empty pool to a depth of 1.5 m?

Your work:

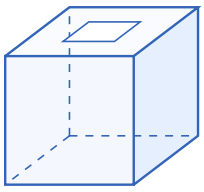

Problem 42 **

In one storm, 15 mm of rain fell on a flat roof 8 m long and 6 m wide. All of the rain ran into a tank. How many litres of water went into the tank?

Your work:

Problem 43 *

A wooden cube has edge 10 cm. A square hole 4 cm by 4 cm is cut straight through it, from the top face to the bottom face. Find the volume of the wood that is left.

Your work:

Problem 44 **

When water freezes, its volume increases by $\frac{1}{11}$. An ice tray holds water 22 cm long, 10 cm wide and 3 cm deep. What is the volume of the ice after the water freezes?

Your work:

Problem 45 *

A tank has a base 2 m long and 1.2 m wide. In the morning the water is 1 m deep; by evening it is 0.65 m deep. How many litres of water were used during the day?

Your work:

Problem 46 **

How many cubes of edge 3 cm can be packed into a box 16 cm long, 12 cm wide and 9 cm high (the cubes sit upright, side by side)? What volume of the box is left empty?

Your work:

Problem 47 *

A cuboid has a volume of 1.2 m^3 and a base area of 0.8 m^2. Its length is 1 m. Find its height and its lateral area.

Your work:

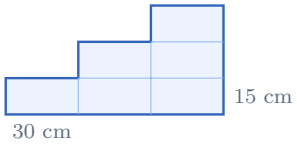

Problem 48 *

All the water from a full cube-shaped tank of edge 6 dm is poured into an empty tank whose base is 9 dm long and 8 dm wide. How deep is the water?

Your work:

Problem 49 ⋆⋆

A flight of 3 concrete steps is 1.5 m wide. Each step is 30 cm deep and 15 cm high (see the side view). Find the volume of concrete.

Your work:

Problem 50 ⋆⋆

A tank is 1.5 m long. The water in it is 60 cm deep. After 240 l of water are added, it is 80 cm deep. Find the width of the tank.

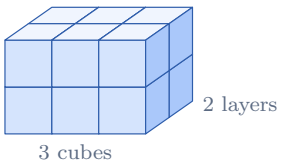

Your work:

5 Cube Stacks and Painted Faces

① Building a box from small blocks

When equal small blocks (unit cubes, small cubes, bricks) are stacked tightly into a new solid, the **volume of the new solid** is the sum of the volumes of the blocks:

$$V_{\text{big}} = V_{\text{one block}} \times \text{number of blocks.}$$

$3 \times 2 \times 2 = 12$ cubes

To find the lateral area, total surface area or volume of a box built from equal blocks:

Step 1. Find the dimensions of the big box:
length = length of a block × number of blocks along the length;
width = width of a block × number of blocks along the width;
height = height of a block × number of layers.

Step 2. Use the formulas for the cuboid or cube.

② How many cubes fit in a box?

To pack cubes of edge a into a box (all lengths in the same unit):

– along each edge of the box, count how many times a fits (the quotient; any remainder is wasted space);
– number of cubes = (number along the length) × (number along the width) × (number along the height).

If a big cube is built from small cubes, the edge of the big cube is a whole number of small edges, so

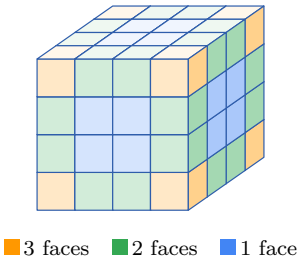

$$\text{number of small cubes} = n \times n \times n, \qquad n = \text{big edge} : \text{small edge}.$$

If we know the total surface area of the big cube, one face is $S_{\text{total}} : 6$, and the edge is the number that multiplied by itself gives this area.

③ Painting the outside of a solid made of small cubes

A big cube with n small cubes along each edge ($n \geq 3$) is painted on all 6 faces, then taken apart:

– **painted on 3 faces**: the cubes at the 8 corners: 8 cubes;
– **painted on exactly 2 faces**: on the 12 edges, not at corners: $12 \times (n-2)$;
– **painted on exactly 1 face**: on the 6 faces, not on edges: $6 \times (n-2) \times (n-2)$;
– **not painted**: the hidden core, a cube of edge $n-2$: $(n-2) \times (n-2) \times (n-2)$.

For a box with a, b, c small cubes along its edges (all ≥ 3):
3 faces: 8; exactly 2 faces: $4 \times [(a-2)+(b-2)+(c-2)]$;
exactly 1 face: $2 \times [(a-2)(b-2)+(b-2)(c-2)+(a-2)(c-2)]$;
none: $(a-2)(b-2)(c-2)$.

Check: the four groups add up to all the small cubes. If an edge has fewer than 3 small cubes, count directly.

④ Counting cubes in a stack. Views

To count the cubes in a stack, count **column by column** (or layer by layer). Unless the problem says otherwise, every cube rests on the table or on another cube, so hidden cubes are under the visible ones.

A **top view with numbers** shows the base squares; the number in each square is how many cubes are stacked there. The number of cubes is the sum of these numbers.

In the **front view**, each column is as tall as the tallest stack in that column.

top view

2	**3**	**1**
1	**2**	**1**

front

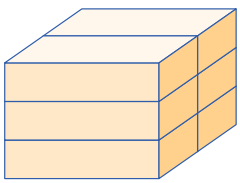

$2+3+1+1+2+1 = 10$ cubes

Example 1

A brick is a cuboid 24 cm long, 12 cm wide and 6 cm high. A builder stacks 6 such bricks into a block shaped like a cuboid: 2 bricks side by side in each layer, 3 layers (see the figure).

a) Find the lateral area and the total surface area of the block.

b) Find the volume of the block.

Guided solution.

a) Length of the block: 24 cm.

Width of the block: $12 \times 2 = 24$ cm.
Height of the block: $6 \times 3 = 18$ cm.
Lateral area: $(24 + 24) \times 2 \times 18 = 1\,728$ cm^2.
Area of the base: $24 \times 24 = 576$ cm^2.
Total surface area: $1\,728 + 576 \times 2 = 2\,880$ cm^2.
b) *Method 1.* $V = 24 \times 24 \times 18 = 10\,368$ cm^3.
Method 2. One brick: $24 \times 12 \times 6 = 1\,728$ cm^3; 6 bricks: $1\,728 \times 6 = 10\,368$ cm^3.
Answer: a) 1 728 cm^2; 2 880 cm^2;
b) 10 368 cm^3.

Example 2

Small cubes of edge 2 cm are stacked into a big cube whose total surface area is 864 cm^2. How many small cubes are used?

Guided solution.

Method 1. One face of the big cube: $864 : 6 = 144$ cm^2.
$144 = 12 \times 12$, so the edge of the big cube is 12 cm.
Along each edge there are $12 : 2 = 6$ small cubes.
Number of small cubes: $6 \times 6 \times 6 = 216$.
Method 2. The edge of the big cube is 12 cm (as above).
Volume of the big cube: $12 \times 12 \times 12 = 1\,728$ cm^3.
Volume of a small cube: $2 \times 2 \times 2 = 8$ cm^3.
Number of small cubes: $1\,728 : 8 = 216$.
Answer: 216 small cubes.

Example 3

A crate (a cuboid) is 1.2 m long, 0.8 m wide and 0.5 m high.

a) At most how many cube-shaped toy blocks of edge 1 dm fit in the crate?

b) At most how many cube-shaped gift boxes of edge 3 dm fit in the crate?

Guided solution.

Change units: 1.2 m = 12 dm; 0.8 m = 8 dm; 0.5 m = 5 dm.
a) Along the length: $12 : 1 = 12$ blocks; along the width: 8 blocks; along the height: 5 blocks.
Number of blocks: $12 \times 8 \times 5 = 480$.
b) Along the length: $12 : 3 = 4$ boxes.
Along the width: $8 : 3 = 2$ (remainder 2 dm), so 2 boxes.
Along the height: $5 : 3 = 1$ (remainder 2 dm), so 1 box.
Number of gift boxes: $4 \times 2 \times 1 = 8$.
Answer: a) 480 blocks;
b) 8 boxes.

Example 4

Mai glues 1 cm cubes into a big cube of edge 5 cm and paints all 6 outside faces.

a) How many small cubes did she use?

b) How many small cubes are painted on 3 faces? On exactly 2 faces? On exactly 1 face? On no face?

Guided solution.

a) Each edge has $5 : 1 = 5$ small cubes.

Number of small cubes: $5 \times 5 \times 5 = 125$.

b) Painted on 3 faces: the 8 corner cubes.

Each edge has $5 - 2 = 3$ cubes that are not corners.

Exactly 2 faces: $12 \times 3 = 36$.

Each face has $3 \times 3 = 9$ cubes not on an edge.

Exactly 1 face: $6 \times 9 = 54$.

No face: the core cube of edge 3: $3 \times 3 \times 3 = 27$.

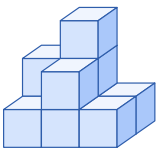

Check: $8 + 36 + 54 + 27 = 125$.

Answer: a) 125;

b) 8; 36; 54; 27.

Example 5

Nam builds the stack of cubes in the figure.

front

a) How many cubes are in the stack?

b) Draw the front view.

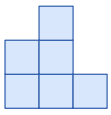

c) How many more cubes does Nam need to turn the stack into a cuboid 3 cubes long, 2 cubes wide and 3 cubes high?

Guided solution.

a) Write the number of cubes on each base square (top view):

2	**3**	**1**
1	**2**	**1**

front

front view

Back row: $2 + 3 + 1 = 6$ cubes; front row: $1 + 2 + 1 = 4$ cubes.

Number of cubes: $6 + 4 = 10$.

b) The columns of the front view are as tall as the tallest stacks: 2, 3, 1 (figure above).

c) The cuboid has $3 \times 2 \times 3 = 18$ cubes.

Cubes still needed: $18 - 10 = 8$.

Answer: a) 10 cubes;

c) 8 cubes.

Practice

Problem 1

How many 1 cm cubes are needed to build a cube of edge 6 cm?

Your work:

Problem 2

How many cubes of edge 3 cm are needed to build a cube of edge 12 cm?

Your work:

Problem 3

How many cubes of edge 2 cm are needed to fill a box 10 cm long, 8 cm wide and 6 cm high?

Your work:

Problem 4

A toy chest is 1.2 m long, 0.6 m wide and 0.4 m high. How many cube-shaped blocks of edge 2 dm fill it exactly?

Problem 6

125 small cubes, each with volume 27 cm^3, are stacked into a big cube. Find the total surface area and the volume of the big cube.

Your work:

Problem 7

A big cube with total surface area 216 cm^2 is built from 1 cm cubes. How many small cubes are used?

Your work:

Problem 8

A big cube with lateral area 400 cm^2 is built from cubes of edge 2 cm. How many small cubes are used?

Your work:

Problem 9

Five bricks, each 20 cm long, 10 cm wide and 5 cm high, are laid flat one on top of another. Find the lateral area, the total surface area and the volume of the pile.

Your work:

Problem 10

Two equal cubes are stacked to make a cuboid 16 cm high. Find the lateral area and the total surface area of the cuboid.

Your work:

Problem 11

Three equal cubes are put in a row to make a cuboid 21 cm long. Find the total surface area of the cuboid.

Your work:

Problem 12

A carton is 60 cm long, 40 cm wide and 30 cm high. How many cube-shaped boxes of edge 10 cm fill it exactly?

Your work:

Problem 13

A drawer is 50 cm long, 35 cm wide and 22 cm high. At most how many cube-shaped boxes of edge 10 cm fit in it?

Your work:

Problem 14

A crate is 9 dm long, 6 dm wide and 4 dm high. Cube-shaped boxes of edge 3 dm are packed in it.

a) At most how many boxes fit?

b) With that many boxes inside, how much space in the crate is left empty?

Your work:

Problem 15

A cube of edge 3 cm made of 1 cm cubes is painted on all its faces. How many small cubes are painted on 3 faces, on exactly 2 faces, on exactly 1 face, on no face?

Your work:

Problem 16

A big cube is made of 216 equal small cubes and then painted on all its faces. How many small cubes are painted on exactly 2 faces? On exactly 1 face?

Your work:

Problem 17

A big cube is made of 343 equal small cubes and then painted on all its faces. How many small cubes have no paint at all?

Your work:

Problem 18

A cube of edge 10 cm is built from 1 cm cubes and painted on all its faces. How many small cubes are painted on at least 2 faces?

Your work:

Problem 19

A cuboid 5 cm long, 4 cm wide and 3 cm high is built from 1 cm cubes and painted on all its faces. How many small cubes are painted on 3 faces, on exactly 2 faces, on exactly 1 face, on no face?

Your work:

Problem 20

A cuboid 14 cm long, 10 cm wide and 6 cm high is built from cubes of edge 2 cm and painted on all its faces. How many small cubes are painted on exactly 2 faces, on exactly 1 face, on no face?

Your work:

Problem 21

A big cube made of equal small cubes is painted on all its faces. Exactly 64 small cubes have no paint. How many small cubes are there in all, and how many are painted on exactly 1 face?

Your work:

Problem 22

A big cube made of equal small cubes is painted on all its faces. Exactly 150 small cubes are painted on just 1 face. How many small cubes are there in all?

Your work:

Problem 23

A big cube is built from 1 cm cubes and painted on all its faces. Exactly 84 small cubes are painted on 2 faces. Find the volume of the big cube.

Your work:

Problem 24

A cube of edge 5 cm is built from 1 cm cubes. The top layer is then lifted off. How many small cubes are left, and what is the total surface area of the remaining solid?

Your work:

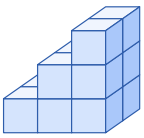

Problem 25

A cube of edge 4 cm is built from 1 cm cubes. One corner cube is removed. Find the total surface area of the remaining solid.

Your work:

Problem 26

How many cubes are there in this staircase? (No cube is missing from the back.)

Your work:

Problem 27

The figure is the top view of a stack of cubes; each number tells how many cubes stand on that square.

a) How many cubes are in the stack?

b) How tall is each column of the front view?

A stack of cubes stands on a base of 3×2 squares; every base square has at least one cube. Its front view and its view from the right are shown. What are the largest and the smallest possible numbers of cubes in the stack?

front view

right view

(front | back)

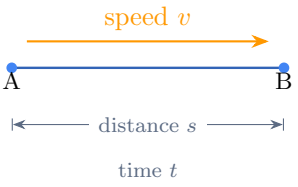

Your work:

6 Uniform Motion

① Speed, distance and time

A **motion problem** is about a person or a vehicle moving from a place A to a place B in a certain amount of time.

– The length AB is the **distance**, written s (usually in km).
– The time taken to go from A to B is the **time**, written t (usually in hours).
– The distance covered in one unit of time is the **speed**, written v.

For example, An cycles 36 km in 3 hours, so his speed is $36 : 3 = 12$ km/h.

In **uniform motion** (steady speed):

$$s = v \times t \qquad v = s : t \qquad t = s : v$$

Units: distance in km and time in hours give speed in km/h; metres and minutes give m/min; metres and seconds give m/s. Always put the quantities in matching units before calculating.

② Units of time and of speed

1 day = 24 h; 1 h = 60 min; 1 min = 60 s; 1 h = 3 600 s.

– Hours to minutes: multiply by 60. $0.4 \text{ h} = 0.4 \times 60 \text{ min} = 24 \text{ min}$.
– Minutes to hours: divide by 60. $1 \text{ h } 15 \text{ min} = 1\frac{15}{60} \text{ h} = 1.25 \text{ h}$.

Changing units of speed:

– 54 km/h: in 1 hour 54 000 m, so in 1 second $54\,000 : 3\,600 = 15$ m. So 54 km/h = 15 m/s.
– In short: km/h → m/s: divide by 3.6; m/s → km/h: multiply by 3.6.
– 600 m/min: in 1 hour $600 \times 60 = 36\,000$ m = 36 km. So 600 m/min = 36 km/h.

③ Working with times of day

When a journey has a departure time, an arrival time and a stop:

travel time = arrival time − departure time − stopping time;

arrival time = departure time + travel time + stopping time.

When adding or subtracting times, work with hours and minutes separately; 60 min make 1 h.

To use $s = v \times t$, write the travel time in hours (as a decimal or a fraction).

travel time = 9 h 20 min − 7 h − 20 min = 2 h

Example 1

Fill in the blanks.

a) 0.75 h = ... min; **b)** 2 h 24 min = ... h; **c)** 3 min 12 s = ... s.

Guided solution.

a) 0.75 h = 0.75 × 60 min = 45 min.

b) 24 min = 24 : 60 h = 0.4 h, so 2 h 24 min = 2.4 h.

c) 3 min = 3 × 60 = 180 s, so 3 min 12 s = 180 + 12 = 192 s.

Answer: a) 45 min;

b) 2.4 h;

c) 192 s.

Example 2

Fill in the blanks.

a) 72 km/h = ... m/s; **b)** 15 m/s = ... km/h; **c)** 800 m/min = ... km/h.

Guided solution.

a) 72 km = 72 000 m; 1 h = 3 600 s.

72 000 : 3 600 = 20, so 72 km/h = 20 m/s.

b) In 1 hour: 15 × 3 600 = 54 000 m = 54 km. So 15 m/s = 54 km/h.

c) In 1 hour: 800 × 60 = 48 000 m = 48 km. So 800 m/min = 48 km/h.

Answer: a) 20 m/s;

b) 54 km/h;

c) 48 km/h.

Example 3

A coach leaves town A at 6:45 and reaches town B, 110 km away, at 9:15. On the way it stops for 30 min. Find the speed of the coach.

Guided solution.

From 6:45 to 9:15: 9 h 15 min − 6 h 45 min = 2 h 30 min.
Travel time: 2 h 30 min − 30 min = 2 h.
Speed: 110 : 2 = 55 km/h.

Answer: 55 km/h.

Example 4

Hùng cycles from home at 7:20 at 14 km/h and arrives at his grandparents' house at 9:05 without stopping. How far is it from his home to his grandparents' house?

Guided solution.

Travel time: 9 h 5 min − 7 h 20 min = 1 h 45 min.
1 h 45 min = $1\frac{45}{60}$ h = 1.75 h.
Distance: 14 × 1.75 = 24.5 km.
Answer: 24.5 km.

Example 5

At 6:30 a lorry leaves A for B, 135 km away, at 45 km/h. At B it stops for 40 min to unload, then drives back to A at 54 km/h. At what time does it get back to A?

Guided solution.

Time from A to B: 135 : 45 = 3 h.
Time from B back to A: 135 : 54 = 2.5 h = 2 h 30 min.
Back at A: 6:30 + 3 h + 40 min + 2 h 30 min = 12:40.
Answer: 12:40.

Practice

Problem 1

Fill in the blanks.

a) 0.4 h = . . . min;

b) 1.25 h = . . . min;

c) 2 h 18 min = . . . h;

d) 45 min = . . . h.

Your work:

Problem 2

Fill in the blanks.

a) 3.5 min = ... s;

b) 2 min 15 s = ... s;

c) 1.5 days = ... h;

d) 150 s = ... min.

Your work:

Problem 3

Fill in the blanks.

a) 36 km/h = ... m/s;

b) 25 m/s = ... km/h;

c) 54 km/h = ... m/min;

d) 750 m/min = ... km/h.

Your work:

Problem 4

Work out.

a) 3 h 45 min + 2 h 30 min;

b) 8 h 10 min − 5 h 35 min;

c) 1 h 25 min × 3;

d) 7 h 30 min : 6.

A runner covers 3 km in 12 min 30 s. Find the speed in m/s and in km/h.

Your work:

Problem 44 ★

Bình cycles for 45 min at 16 km/h; then his bike breaks and he walks the remaining 2.4 km in 36 min. How long is the whole road, and how fast did he walk?

Your work:

Problem 45 ★★

The road AB is 60 km long. A car spends half of its travel time at 40 km/h and the other half at 60 km/h. How long does it take from A to B?

Your work:

Problem 46 ★★

The road AB is 60 km long. A car covers the first half of the road at 30 km/h and the second half at 60 km/h. Find the total time and the average speed. Is the average speed 45 km/h?

Your work:

Problem 47 ★

On a motorway, Dad's car passes one kilometre post every 48 seconds. What is its speed in km/h?

Your work:

Problem 48 ★★

A tortoise and a hare race over 120 m. The tortoise crawls steadily at 0.2 m/s. The hare runs at 6 m/s, stops after 90 m to sleep, then wakes up and runs the last 30 m at the same speed. At most how long can the hare sleep and still not lose?

Your work:

Problem 49 ★★

A train leaves station A at 19:20 and reaches station B, 570 km away, at 6:05 the next day. Its stops at stations add up to 1 h 15 min. Find the speed of the train while it is moving.

Your work:

Problem 50 ★★

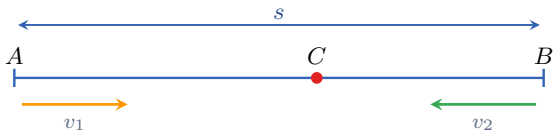

The road AB is 115 km long. A car leaves A at 7:00 and must reach B at 9:30. For the first 1 h 15 min it goes at 40 km/h. At what speed must it cover the rest of the road?

Your work:

7 Meeting and Catching Up

① Two objects moving towards each other

Two objects start *at the same time* from A and B, a distance s apart, and move towards each other with speeds v_1 and v_2.

- Every hour the gap between them shrinks by $v_1 + v_2$ (the *closing speed*).
- Time until they meet: $t = s : (v_1 + v_2)$.
- The meeting point C is $v_1 \times t$ from A and $v_2 \times t$ from B.
- Clock time of meeting = starting time + t.
- If one object sets off earlier, first find how far it has gone by the time the other one starts; the *remaining* distance is then shared as above.

② Two objects moving in the same direction

Two objects start *at the same time* from A and B (s apart) and move in the same direction $A \to B$; the one behind is faster: $v_1 > v_2$.

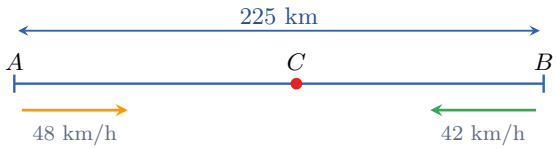

- Every hour the faster one gains $v_1 - v_2$ on the slower one.
- Time to catch up: $t = s : (v_1 - v_2)$; the catching point is $v_1 \times t$ from A.
- If both start from the *same place* at *different times*, the head start is $s = v_2 \times$ (difference in starting times).

Note: use the same units throughout (km, h, km/h or m, min, m/min). Two objects moving *away* from each other (opposite directions from the same point) separate by $v_1 + v_2$ every hour.

Example 1

Two towns A and B are 225 km apart. At 6:45 a car leaves A for B at 48 km/h; at the same time a coach leaves B for A at 42 km/h. At what time do they meet, and how far from A is the meeting point?

Guided solution.

Every hour the two vehicles close up: $48 + 42 = 90$ (km).
Time until they meet: $225 : 90 = 2.5$ (h) $= 2$ h 30 min.
They meet at: 6:45 + 2 h 30 min = 9:15.
The meeting point is $48 \times 2.5 = 120$ (km) from A.

Answer: 9:15; 120 km from A.

Example 2

At 7:10 Lan leaves school by bicycle at 12 km/h. At 7:40 her brother leaves the school on a motorbike at 36 km/h and rides after her along the same road. At what time does he catch up with her, and how far from school?

Guided solution.

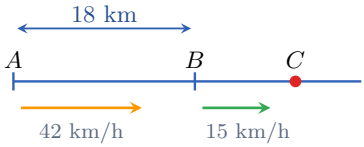

Lan's head start in time: 7:40 − 7:10 = 30 min = 0.5 h.
Distance Lan has covered by 7:40: $12 \times 0.5 = 6$ (km).
Every hour the motorbike gains: $36 - 12 = 24$ (km).
Time to catch up: $6 : 24 = 0.25$ (h) $= 15$ min. They meet at 7:40 + 15 min = 7:55.
Distance from school: $36 \times 0.25 = 9$ (km).

Answer: 7:55; 9 km from school.

Example 3

Points A and B are 18 km apart. At 6:30 a motorbike leaves A at 42 km/h and, at the same time, a cyclist leaves B at 15 km/h; both travel in the direction from A to B. At what time does the motorbike catch the cyclist, and how far from A?

Guided solution.

Every hour the motorbike gains: $42 - 15 = 27$ (km).

Time to catch up: $18 : 27 = \frac{2}{3}$ (h) $= 40$ min. It catches up at 6:30 + 40 min = 7:10.

Distance from A: $42 \times \frac{2}{3} = 28$ (km).

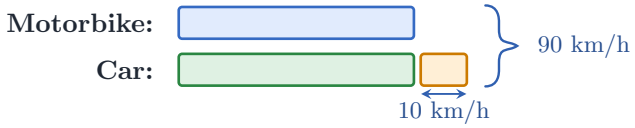

Answer: 7:10; 28 km from A.

Example 4

Two towns are 180 km apart. A car and a motorbike set off from the two towns at the same time towards each other and meet after 2 hours. The car is 10 km/h faster than the motorbike. Find the speed of each.

Guided solution.

Sum of the two speeds (the closing speed): $180 : 2 = 90$ (km/h).

Speed of the motorbike: $(90 - 10) : 2 = 40$ (km/h).

Speed of the car: $40 + 10 = 50$ (km/h).

Answer: car 50 km/h, motorbike 40 km/h.

Example 5

Two places are 150 km apart. At 8:00 two cars leave them and drive towards each other at 35 km/h and 40 km/h. At what time are the two cars 30 km apart?

Guided solution.

Every hour the cars close up by $35 + 40 = 75$ (km). There are *two* moments when they are 30 km apart.

Before they meet: together they have driven $150 - 30 = 120$ (km); time: $120 : 75 = 1.6$ (h) $= 1$ h 36 min, so at 9:36.

After they meet: together they have driven $150 + 30 = 180$ (km); time: $180 : 75 = 2.4$ (h) $= 2$ h 24 min, so at 10:24.

Answer: at 9:36 and at 10:24.

Practice

Problem 1

Two villages are 36 km apart. Two cyclists leave the villages at the same time and ride towards each other at 13 km/h and 11 km/h. After how long do they meet?

Your work:

Problem 2

Road AB is 279 km long. At 7:20 a car leaves A for B at 68 km/h; at the same time a coach leaves B for A at 56 km/h. At what time do they meet?

Your work:

Problem 3

Two cities A and B are 168 km apart. At the same moment a motorbike leaves A at 38 km/h and a car leaves B at 46 km/h, heading towards each other. After how long do they meet, and how far from A?

Your work:

Problem 4

Two towns A and B are 210 km apart. At 6:30 two cars leave A and B and drive towards each other, the car from A at 45 km/h and the car from B at 39 km/h. At what time do they meet, and how far from A is the meeting point?

Your work:

Problem 5

Two towns are 196 km apart. A car and a motorbike leave the two towns at the same time towards each other and meet after 2 h 20 min. The car is 12 km/h faster than the motorbike. Find the speed of each.

Your work:

Problem 6

Two towns A and B are 245 km apart. Two cars leave A and B at the same time towards each other and meet after 2.5 h at a point C that is 105 km from A. Find the speed of each car.

Your work:

Problem 7

Road AB is 288 km long. A car and a motorbike leave A and B at the same time towards each other and meet after 3 h 12 min. The car's speed is 1.5 times the motorbike's. Find the speed of each.

Your work:

Problem 8

Road AB is 270 km long. At 7:00 a lorry leaves A for B at 40 km/h. At 8:15 a car leaves B for A at 60 km/h. At what time do they meet, and how far from A?

Your work:

Problem 9

At 6:30 a coach leaves A for B at 50 km/h. Half an hour later a second coach leaves B for A at 45 km/h. The two coaches meet at 9:00. How long is road AB?

Your work:

Problem 10

Two places are 160 km apart. Two cars leave them at the same time and drive towards each other at 38 km/h and 42 km/h. How far apart are they after 1 h 30 min?

Your work:

Problem 11

Two cars leave A and B at the same time and drive towards each other. The first car needs 4 h to drive the whole road AB; the second needs 6 h. After 2 h the cars are still 30 km apart. How long is road AB?

Your work:

Problem 12

A motorbike needs 3 h to ride from A to B; a bicycle needs 6 h to ride from B to A. They set off at the same time towards each other. After how long do they meet?

Your work:

Problem 13

Lan's house and Mai's house are 2.4 km apart. At 16:40 the two girls leave home and walk towards each other, Lan at 4.5 km/h and Mai at 3.5 km/h. After how many minutes do they meet, and at what time?

Your work:

Problem 14

A and B are 24 km apart. A walker leaves A at 4 km/h and, at the same time, a cyclist leaves B at 12 km/h; they go towards each other. How far from A do they meet?

Your work:

Problem 15

Road AB is 132 km long. A car leaves A at 52 km/h and, at the same time, a motorbike leaves B; they travel towards each other and meet after 1 h 30 min. Find the speed of the motorbike.

Your work:

Problem 16

A and B are 48 km apart. At the same time a car leaves A at 58 km/h and a motorbike leaves B at 42 km/h, both going in the direction from A to B. After how long does the car catch the motorbike, and how far from A?

Your work:

Problem 17

At 6:40 a cyclist leaves a town at 14 km/h. At 7:10 a motorbike leaves the same place at 35 km/h and follows the same road. At what time does the motorbike catch the cyclist?

Your work:

Problem 18

A car leaves A and a bicycle leaves B at the same time, both going in the direction from A to B. The car drives at 52 km/h and the bicycle at 16 km/h. The car catches the bicycle after 1 h 45 min. How far apart are A and B?

Your work:

Problem 19

A cyclist riding at 15 km/h has already covered 15 km when a motorbike sets off after him from the same starting point at 40 km/h. After how many minutes does the motorbike catch the cyclist?

Your work:

Problem 20

At 8:00 a lorry leaves A at 45 km/h. At 9:20 a car leaves A at 75 km/h along the same road. At what time does the car catch the lorry, and how far from A?

Your work:

Problem 21

A and B are 36 km apart. Two cars leave A and B at the same time in the same direction (from A to B). After 3 h the car from A catches the car from B. The sum of their speeds is 84 km/h. Find the speed of each car.

Your work:

Problem 22

A motorbike is 30 km behind a lorry; both drive in the same direction, the motorbike at 50 km/h and the lorry at 35 km/h. How far apart are they after 1 h 20 min?

Your work:

Problem 23

Nam leaves home by bicycle at 250 m/min. 6 minutes later his mum sets off after him on a motorbike at 550 m/min. After how many minutes does Mum catch Nam, and how far from home?

Your work:

Problem 24

Two cars leave the same crossroads at the same time and drive in opposite directions, at 45 km/h and 55 km/h. After how long are they 250 km apart?

Your work:

Problem 25

At 7:00 two cars leave the same place and drive along the same road in the same direction, at 42 km/h and 54 km/h. At what time are they 15 km apart?

Your work:

Problem 26

At 7:00 a cyclist leaves A at 12 km/h. At 8:00 a motorbike leaves A along the same road and catches the cyclist at 8:30. Find the speed of the motorbike.

Your work:

Problem 27

Road AB is 150 km long. At 7:00 a car leaves A at 50 km/h and a motorbike leaves B at 40 km/h, towards each other. Before they meet, the motorbike rider stops to rest for 18 minutes. At what time do they meet, and how far from A?

Your work:

Problem 28

Two towns are 120 km apart. At 7:00 a coach and a car leave the two towns towards each other at 42 km/h and 53 km/h. At what time, before they meet, are they 25 km apart?

Your work:

Problem 29

At 6:00 a motorbike leaves A for B at 40 km/h. At 7:00 a car leaves A at 60 km/h on the same road and catches the motorbike exactly at B. How long is road AB?

Your work:

Problem 30

Lan's house and Hoa's house are 4.2 km apart. At 6:45 Lan walks from her house at 80 m/min and Hoa cycles from her house at 200 m/min, towards each other. At what time do they meet, and how far from Lan's house?

Your work:

Challenge – Extension

Problem 31 ★★

Road AB is 240 km long. At 7:00 a car leaves A for B at 80 km/h; at the same time a motorbike and a lorry leave B for A at 30 km/h and 50 km/h. At what time is the car exactly halfway between the motorbike and the lorry?

Your work:

Problem 32 ★

Road AB is 150 km long. Two cars start from A and B at the same time. If they drive towards each other, they meet after 1 h 15 min. If they drive in the same direction (from A towards B), the car from A catches the other after 7 h 30 min. Find the speed of each car.

Your work:

Problem 33 ★

A and B are 90 km apart. Two riders start from A and B at the same time. Riding towards each other they meet after 1.5 h; riding in the same direction, the rider from A catches the other after 4.5 h. Find their speeds.

Your work:

Problem 34 *

Two cars at A and B, 60 km apart, set off at the same time in the same direction towards C (B lies between A and C). After 2.5 h the car from A catches the car from B. The sum of their speeds is 104 km/h. Find the speed of each.

Your work:

Problem 35 **

Two cars leave A and B at the same time towards each other and first meet 40 km from A. Each car drives on to the other end, turns back at once and they meet a second time 20 km from B. How long is road AB?

Your work:

Problem 36 *

Road AB is 210 km. Two cars leave A and B at the same time towards each other and meet after 2 h. At that moment the car from A has gone 30 km more than the car from B. Find their speeds.

Your work:

Problem 37

At 6:00 a cyclist leaves A at 15 km/h. When he reaches the 15-km mark he rests there for 30 minutes, then rides on. At 7:00 a motorbike leaves A at 45 km/h along the same road. At what time does the motorbike catch the cyclist?

Your work:

Problem 38

Two friends are 6 km apart and walk towards each other at 4 km/h and 5 km/h. A dog starts with the first friend and runs at 15 km/h to the second, then back to the first, and so on until the friends meet. How far does the dog run?

Your work:

Problem 39

At 7:00 a lorry leaves A at 40 km/h. At 8:00 a car leaves A at 60 km/h on the same road. After the car has started, at what times are the two vehicles 10 km apart?

Your work:

Problem 40

At 8:00 a motorbike leaves A for B at 36 km/h; $AB = 108$ km. A car drives at 54 km/h. At what time must the car leave A to catch the motorbike exactly at B?

Your work:

Problem 41 ★★

A car leaves A at 45 km/h. Half an hour later a second car leaves B at 60 km/h and drives towards A. They meet exactly at the midpoint of AB. How long is AB?

Your work:

Problem 42 ★

Two cars leave A and B at the same time towards each other at 50 km/h and 62 km/h. They meet at a point 18 km from the midpoint of AB. How long is AB?

Your work:

Problem 43 ★

Two cyclists leave A and B at the same time towards each other at 15 km/h and 10 km/h. After meeting, the faster cyclist needs 40 more minutes to reach B. After how long did they meet, and how long is AB?

Your work:

Problem 44 **

A and B are 90 km apart. If a cyclist from A and a motorbike from B start at the same time towards each other, they meet after 2 h. If the cyclist starts 1 h earlier, they meet 1 h 36 min after the motorbike starts. Find the speed of each.

Your work:

Problem 45 **

At exactly 3:00 the minute hand of a clock points to 12 and the hour hand to 3. After how many minutes does the minute hand first catch up with the hour hand?

Your work:

Problem 46 *

Road AB is 240 km. At 7:00 two cars leave A and B towards each other and meet at 9:00. The speed of the car from A is $\frac{3}{5}$ of the speed of the car from B. Find the speeds and the distance from A to the meeting point.

Your work:

Problem 47 *

At 7:00 car X is 40 km behind car Y on the same road; both drive forward, X at 60 km/h and Y at 40 km/h. At 8:00 car Y speeds up to 50 km/h. At what time does X catch Y?

Your work:

Problem 48 **

At 6:00 a walker leaves A for B at 5 km/h. At 7:00 a cyclist leaves A at 15 km/h along the same road. The cyclist overtakes the walker, rides on and reaches B 1 hour before the walker. How long is AB?

Your work:

Problem 49 *

Hoa's house and Lan's house are 3.4 km apart. At 7:00 Hoa walks towards Lan's house at 80 m/min; at 7:05 Lan walks towards Hoa's house at 70 m/min. At what time do they meet, and how far from Hoa's house?

Your work:

Problem 50 **

Car X drives the whole road AB in 6 h; car Y drives it in 4 h. Car X leaves A for B; 1 hour later car Y leaves B for A. How long after car Y starts do they meet?

Your work:

8 Speed Ratios and Average Speed

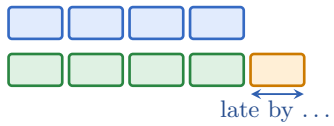

① Speed, distance and time depend on each other

$$s = v \times t; \qquad v = s : t; \qquad t = s : v.$$

- **Same distance:** the faster you go, the less time you need. If the speed becomes k times as big, the time becomes k times as small. We say speed and time are *inversely proportional*: the ratio of the times is the ratio of the speeds turned upside down.
- **Same speed:** a longer distance needs a longer time; distance and time are *directly proportional*.
- **Same time:** the faster object goes further; distance and speed are *directly proportional*.

② Using ratios with bar models

On the same road, if the planned speed and the actual speed are in the ratio $\frac{a}{b}$, then the planned time and the actual time are in the ratio $\frac{b}{a}$. Draw the two times as bars made of equal parts: the *difference in time* (late, early, longer, shorter) matches the *difference in parts*. From one part we get the time, then the distance.

③ Average speed

- **Average speed = total distance : total time.**
- In general the average speed is *not* the average of the speeds. For example, going half the way at 12 km/h and half the way at 4 km/h does *not* give 8 km/h.
- When the distance is not given ("half the way", "there and back"), choose a convenient length for it, usually a number divisible by all the speeds (*reducing to a unit*), and work out the times.

Example 1

Huy cycles 18 km in 1 h 30 min. At the same speed, how long does he need to cycle 30 km?

Guided solution.

The speed is the same, so the time grows in the same ratio as the distance.

$30 : 18 = \frac{5}{3}$, so the distance is $\frac{5}{3}$ times as long.

Time: $1.5 \times \frac{5}{3} = 2.5$ (h) $= 2$ h 30 min.

Another way: speed $18 : 1.5 = 12$ *(km/h); time* $30 : 12 = 2.5$ *(h).*

Answer: 2 h 30 min.

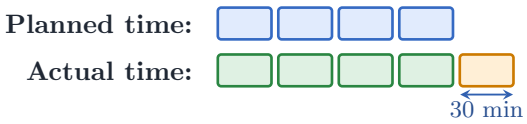

Example 2

A car planned to drive from A to B at 60 km/h. Because of road works it could only drive at 48 km/h and arrived 30 minutes late. How long is road AB?

Guided solution.

Ratio of planned speed to actual speed: $\frac{60}{48} = \frac{5}{4}$.

On the same road speed and time are inversely proportional, so planned time : actual time $= \frac{4}{5}$.

Difference: $5 - 4 = 1$ part $= 30$ min. Actual time: $30 \times 5 = 150$ (min) $= 2.5$ h.

$AB = 48 \times 2.5 = 120$ (km).

Answer: 120 km.

Example 3

A car drives road AB in 4 h; a motorbike drives the same road in 6 h. The car is 15 km/h faster than the motorbike. Find both speeds and the length of AB.

Guided solution.

Time of car : time of motorbike $= \frac{4}{6} = \frac{2}{3}$; so speed of car : speed of motorbike $= \frac{3}{2}$.

Difference: $3 - 2 = 1$ part $= 15$ km/h.

Car: $15 \times 3 = 45$ (km/h); motorbike: $45 - 15 = 30$ (km/h).

$AB = 45 \times 4 = 180$ (km).

Answer: car 45 km/h, motorbike 30 km/h; $AB = 180$ km.

Example 4

Thu cycles from A to B at 12 km/h. On the way back, she rides the first 6 km at 12 km/h, then a strong wind slows her to 10 km/h for the rest of the way. So the way back takes 12 minutes longer than the way there. How long is AB?

Guided solution.

Let C be the point 6 km from B. Both trips take the same time on BC; the extra 12 min comes from the part CA.

On CA: planned speed : actual speed $= \frac{12}{10} = \frac{6}{5}$, so planned time : actual time $= \frac{5}{6}$.

$6 - 5 = 1$ part $= 12$ min; actual time on CA: $12 \times 6 = 72$ (min) $= 1.2$ h.

$CA = 10 \times 1.2 = 12$ (km); $AB = 12 + 6 = 18$ (km).

Answer: 18 km.

Example 5

a) A motorbike rides for 2 h at 45 km/h and then for 1 h at 60 km/h. Find its average speed.

b) Khoa cycles the first half of a road at 12 km/h, then his bike breaks and he walks the second half at 4 km/h. Find his average speed over the whole road.

Guided solution.

a) Total distance: $45 \times 2 + 60 \times 1 = 150$ (km); total time: $2 + 1 = 3$ (h).

Average speed: $150 : 3 = 50$ (km/h).

b) 12 is divisible by both 12 and 4; suppose half the road is 12 km (a unit chosen for convenience).

First half: $12 : 12 = 1$ (unit of time); second half: $12 : 4 = 3$ (units).

Whole road: 24 km in $1 + 3 = 4$ units; average speed: $24 : 4 = 6$ (km/h).

It is not $(12 + 4) : 2 = 8$ *km/h: Khoa spends much longer walking than cycling.*

Answer: a) 50 km/h; b) 6 km/h.

Practice

Problem 1

A motorbike rides 96 km in 2 h 40 min. At the same speed, how far does it ride in 4 h?

Your work:

Problem 2

A car drives 150 km in 2.5 h. At the same speed, how long does it need for 210 km?

Your work:

Problem 3

A cyclist and a motorbike leave a town at the same time. The motorbike's speed is 2.5 times the cyclist's. When the cyclist has ridden 14 km, how far has the motorbike gone?

Your work:

Problem 4

Towns X and Y are 150 km apart. A car drives from X to Y at 60 km/h; at the same time a motorbike rides from Y to X at 40 km/h. When the car reaches Y, how far is the motorbike from X?

Your work:

Problem 5

A car drives the 96 km from A to B at 48 km/h. During the same time a motorbike leaves A along the same road at a speed equal to $\frac{3}{4}$ of the car's speed. When the car reaches B, how far is

the motorbike from B?

Your work:

Problem 6

A motorbike at 40 km/h needs 3 h for a road. A car drives 1.5 times as fast. How long does the car need for the same road?

Your work:

Problem 7

A motorbike at 42 km/h covers a road in 2 h 30 min. A car drives the same road at 60 km/h and leaves at 6:50. At what time does the car arrive?

Your work:

Problem 8

A motorbike planned to ride from A to B in 4 h, but it actually took 3 h 12 min because it rode 10 km/h faster. Find its actual speed.

Your work:

Problem 9

A coach planned to drive at 50 km/h but, because of heavy traffic, could only drive at 40 km/h and arrived 36 minutes late. How long was the journey?

Your work:

Problem 10

A car planned to drive at 45 km/h but actually drove at 54 km/h and arrived 20 minutes early. How long was the road?

Your work:

Problem 11

Bình cycles home from school at 15 km/h. Halfway, his tyre goes flat and he walks the rest of the way at 5 km/h. The whole trip takes 40 minutes. How far is Bình's home from school?

Your work:

Problem 12

A coach drives the first half of a road at 60 km/h; then rain slows it to 40 km/h for the second half. The whole trip takes 5 h. How long is the road?

Your work:

Problem 13

A delivery van leaves A at 7:15, drives to B at 40 km/h, spends 45 minutes unloading, then drives straight back at 60 km/h and arrives at A at 11:30. How long is road AB?

Your work:

Problem 14

Mr Tâm rides from A to B in 2 h. On the way back he rides 12 km/h slower, and the trip takes 30 minutes longer. How long is AB?

Your work:

Problem 15

A driver works out that at 50 km/h he will arrive at 10:12, and at 60 km/h he will arrive at 9:42. How long is the journey?

Your work:

Problem 16

A car must get from A to B in a fixed time. At 40 km/h it would be 20 min late; at 50 km/h it would be 16 min early. Find the length of AB and the fixed time.

Your work:

Problem 17

Brothers Quân and Khoa ride from home to their grandmother's house. Quân rides at 45 km/h. Khoa leaves 9 minutes after Quân, rides at 54 km/h and arrives 3 minutes before him. How far is it to Grandma's house?

Your work:

Problem 18

Minh cycles from home to school at 12 km/h. On the way back he rides the first 2 km at 12 km/h, then speeds up to 16 km/h. The way back takes 5 minutes less. How far is school from home?

Your work:

Problem 19

A coach leaves the city at 7:00 for a town 150 km away, planning to drive the whole way at 50 km/h. On the way it stops for 12 minutes; then it drives on at 60 km/h and arrives 3 minutes earlier than planned. How far from the city did it stop?

Your work:

Problem 20

Two cars leave at the same time. In the same time car X goes 150 km and car Y goes 120 km. Car X is 12 km/h faster. Find both speeds.

Your work:

Problem 21

A car drives road AB in 3 h; a motorbike needs 5 h. The car is 24 km/h faster. Find both speeds and the length of AB.

Your work:

Problem 22

A lorry drives for 1.5 h at 40 km/h and then for 0.5 h at 60 km/h. Find its average speed.

Your work:

Problem 23

Grandpa walks 2 km in 30 min, then 3 km in 45 min. Find his average speed in km/h.

Your work:

Problem 24

A car drives a road of 160 km: the first half at 60 km/h and the second half at 40 km/h. Find its average speed.

Your work:

Problem 25

A motorbike rides from A to B at 30 km/h and returns along the same road at 20 km/h. Find its average speed for the round trip.

Your work:

Problem 26

A car drives for 3 h at an average speed of 50 km/h. In the first 2 h it drove at 45 km/h. What was its speed in the third hour?

Your work:

Problem 27

A hiker climbs a hill at 3 km/h and comes down the same path at 6 km/h. Find the average speed for the whole walk.

Your work:

Problem 28

A road is divided into three equal parts. A cyclist rides them at 30 km/h, 20 km/h and 60 km/h. Find the average speed over the whole road.

Your work:

Problem 29

In the time Lan walks 600 m, Mai cycles 1.5 km. Lan walks at 4 km/h. Find Mai's speed.

Your work:

Problem 30

A car usually needs 2 h for a road. Today it drives at $\frac{4}{5}$ of its usual speed. How many minutes late is it?

Your work:

Challenge – Extension

Problem 31 *

Road AB consists of an uphill part and a downhill part. Vy walks from A to B and back, going uphill at 4 km/h and downhill at 6 km/h. The round trip takes 5 h. How long is AB?

Your work:

Problem 32 ★★

Road AB has an uphill part followed by a downhill part. Uphill speed 4 km/h, downhill speed 6 km/h. Going from A to B takes 2 h 20 min; returning takes 2 h 40 min. How long is AB, and how long is the uphill part on the way from A?

Your work:

Problem 33 ★

A car drives the first half of a road at 40 km/h. How fast must it go on the second half for the average speed to be 48 km/h?

Your work:

Problem 34 ★★

Lâm cycles the first half of a road at 30 km/h. Can he ride the second half fast enough to make his average speed 60 km/h?

Your work:

Problem 35 *

A cyclist leaves at 7:00 and arrives at 8:30, 18 km away, after a 15-minute rest on the way. Find **a)** the average speed for the whole trip; **b)** the speed while riding.

Your work:

Problem 36 *

A driver works out that at 45 km/h he arrives at 10:00, and at 60 km/h at 9:15. How long is the journey, and at what time does he set off?

Your work:

Problem 37 *

Road AB is 120 km. A car plans to drive at 40 km/h. After 1 h it speeds up by 10 km/h. How many minutes early does it arrive?

Your work:

Problem 38 **

A car planned to drive at 50 km/h. After 1 h it had to slow down to 40 km/h, and it arrived 24 minutes late. How long was the road?

Your work:

Problem 39 *

A car drives from A to B in 2 h at 45 km/h and returns along the same road in 3 h. Find the average speed for the round trip.

Your work:

Problem 40 *

a) A car drives half of the *time* at 40 km/h and the other half of the time at 60 km/h. **b)** Another car drives half of the *distance* at 40 km/h and the other half at 60 km/h. Find each average speed.

Your work:

Problem 41 **

If a car increases its speed by a quarter, it arrives 30 minutes earlier. How long does the trip take at the usual speed?

Your work:

Problem 42 *

Two cyclists leave the same place at the same time in the same direction. After 1.5 h the first is 6 km ahead of the second. The first rides at $\frac{5}{4}$ of the second's speed. Find their speeds.

Your work:

Problem 43 *

Phong cycles from A to B at 18 km/h. Coming back he rides the first 6 km at 18 km/h, then 15 km/h, and the way back takes 8 minutes longer. How long is AB?

Your work:

Problem 44 *

A car drives from A to B at 36 km/h and back at 45 km/h. Find the average speed for the round trip.

Your work:

Problem 45 *

Ngân walks to school at 5 km/h and walks home along the same road at 3 km/h. Altogether she walks for 48 minutes. How far is school?

Your work:

Problem 46 **

A motorbike leaves A at 7:00 and a car leaves A at 8:00 on the same road; they both reach B at the same moment. The car is 1.5 times as fast as the motorbike, and $AB = 120$ km. At what time do they reach B, and what are their speeds?

Your work:

Problem 47 *

In 2 h car X goes 30 km further than car Y. Their speeds are in the ratio $7:5$. Find both speeds.

Your work:

Problem 48 *

Hà must cover 32 km in 2 h. She rides the first 1 h 20 min at 15 km/h. At what speed must she ride the rest?

Your work:

Problem 49 *

Anh walks 2.4 km in 30 min; Bảo walks 3 km in 40 min. Each walks 6 km. How many minutes longer does the slower one take?

Your work:

Problem 50 **

A car drives for 2 h at 60 km/h and then for a while at 40 km/h. Its average speed for the whole trip is 48 km/h. How long did it drive at 40 km/h?

Your work:

9 River Currents and Long Objects

① Boats on a river

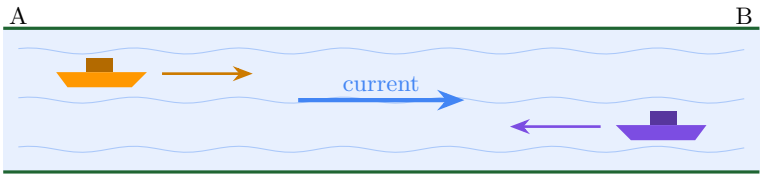

- The water of a river flows in one direction. A boat going *with* the current (downstream) is helped by the water; a boat going *against* the current (upstream) is held back by it.
- Let v_{boat} be the speed of the boat in still water and v_{current} the speed of the current. Then

$$v_{\text{down}} = v_{\text{boat}} + v_{\text{current}}, \qquad v_{\text{up}} = v_{\text{boat}} - v_{\text{current}}.$$

- Hence $v_{\text{down}} - v_{\text{up}} = 2 \times v_{\text{current}}$, so

$$v_{\text{current}} = (v_{\text{down}} - v_{\text{up}}) : 2, \qquad v_{\text{boat}} = (v_{\text{down}} + v_{\text{up}}) : 2.$$

- A raft, a leaf or a log floating on the water (no engine, no oars) moves at exactly the speed of the current.

downstream: $v_{\text{boat}} + v_{\text{current}}$

upstream: $v_{\text{boat}} - v_{\text{current}}$

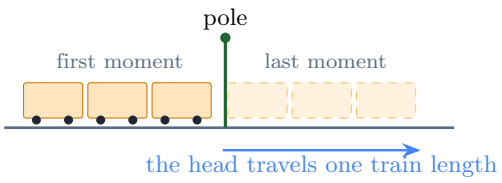

Note: when the same stretch AB is travelled both ways, the times are in the *inverse* ratio of the speeds: the faster trip takes less time.

② Trains: moving objects that have a length

A train is long, so "the train has passed" something only when its *tail* has gone by. We follow the *head* of the train and ask how far it travels.

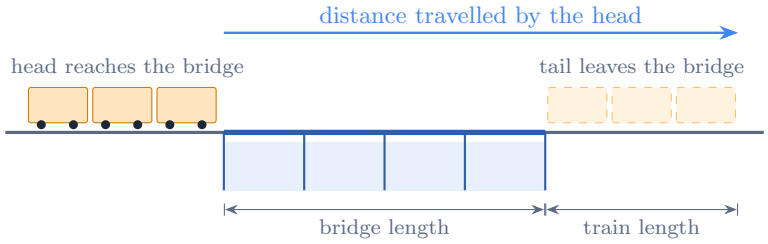

a) Passing a pole (a tree, a person standing still): from the moment the head reaches the pole until the tail leaves it, the head travels *one train length*.

time to pass a pole = train length : train speed.

b) Crossing a bridge (or a tunnel, a platform): from the moment the head reaches the bridge until the tail leaves it, the head travels the *bridge length plus the train length*.

$$\text{time to cross a bridge} = (\text{train length} + \text{bridge length}) : \text{train speed}.$$

Units: 1 m/s = 3.6 km/h. For example 54 km/h = 54 000 m : 3 600 s = 15 m/s.

③ A train and another moving object

- **Two trains in opposite directions** (on parallel tracks): from "the heads meet" to "the tails part", together they cover the sum of the two lengths.

$$\text{time} = (\text{length}_1 + \text{length}_2) : (v_1 + v_2).$$

- **One train overtaking another** (same direction): the faster train must gain the sum of the two lengths.

$$\text{time} = (\text{length}_1 + \text{length}_2) : (v_1 - v_2).$$

- **A train and a cyclist, walker or car** (a short object, its length ignored): replace the sum of the lengths by the train length only; opposite directions: time = train length : $(v_{\text{train}} + v)$; same direction: time = train length : $(v_{\text{train}} - v)$.
- A passenger *sitting* in one train who watches another train go past sees only the length of the *other* train.

Example 1

The river stretch AB is 36 km long and the current flows from A to B at 3 km/h. At 6:30 a boat whose speed in still water is 15 km/h leaves A for B, rests 30 minutes at B and then returns to A. At what time does it get back to A?

Guided solution.

Downstream speed: $15 + 3 = 18$ (km/h); time from A to B: $36 : 18 = 2$ (h).
Upstream speed: $15 - 3 = 12$ (km/h); time from B to A: $36 : 12 = 3$ (h).
Back at A: 6 h 30 min + 2 h + 30 min + 3 h = 12 h 00 min.

Answer: at 12:00 (noon).

Example 2

A canoe goes downstream from A to B in 4 hours and comes back upstream from B to A in 6 hours. How long does a raft take to drift from A to B?

Guided solution.

Method 1 (choose a length). Let AB be 12 equal units (12 is divisible by both 4 and 6).
Downstream speed: $12 : 4 = 3$ (units per hour); upstream speed: $12 : 6 = 2$ (units per hour).
Speed of the current (= speed of the raft): $(3 - 2) : 2 = 0.5$ (units per hour).
Time for the raft: $12 : 0.5 = 24$ (h).

Method 2 (fractions of AB). In 1 hour the canoe covers $\frac{1}{4}$ of AB downstream and $\frac{1}{6}$ of AB upstream.

In 1 hour the current carries the raft $\left(\frac{1}{4} - \frac{1}{6}\right) : 2 = \frac{1}{24}$ of AB, so the raft needs 24 hours.

Answer: 24 hours.

Example 3

A train travelling at 54 km/h passes an electricity pole in 8 seconds.

a) How long is the train?

b) At the same speed, how long does it take to cross a bridge 330 m long?

Guided solution.

54 km/h = 54 000 m : 3 600 s = 15 m/s.
a) Passing the pole, the train travels its own length: $15 \times 8 = 120$ (m).
b) Crossing the bridge, it travels $120 + 330 = 450$ (m); time: $450 : 15 = 30$ (s).
Answer: a) 120 m; **b)** 30 seconds.

Example 4

Train P is 160 m long and runs at 20 m/s. Train Q is 140 m long and runs at 10 m/s on a parallel track. How long does it take them to pass each other

a) if they run in opposite directions?

b) if P overtakes Q (same direction)?

Guided solution.

In both cases the distance to be covered is the sum of the lengths: $160 + 140 = 300$ (m).
a) Opposite directions: they close up $20 + 10 = 30$ m each second; time: $300 : 30 = 10$ (s).

b) Same direction: P gains $20 - 10 = 10$ m each second; time: $300 : 10 = 30$ (s).

Answer: a) 10 seconds; **b)** 30 seconds.

Example 5

A train 150 m long crosses a bridge 210 m long in 24 seconds. The same train overtakes a cyclist riding in the same direction in 12 seconds. Find the cyclist's speed.

Guided solution.

Speed of the train: $(150 + 210) : 24 = 15$ (m/s).

Method 1. In 12 s the head of the train travels $15 \times 12 = 180$ (m). It started level with the cyclist and finished one train length ahead, so the cyclist rode $180 - 150 = 30$ (m).

Cyclist's speed: $30 : 12 = 2.5$ (m/s).

Method 2. The train gains 150 m in 12 s, so the difference of the speeds is $150 : 12 = 12.5$ (m/s).

Cyclist's speed: $15 - 12.5 = 2.5$ (m/s) $= 9$ km/h.

Answer: 2.5 m/s (that is, 9 km/h).

Practice

Problem 1

A boat's speed in still water is 16 km/h and the current flows at 2 km/h. Find the boat's speed downstream and its speed upstream.

Your work:

Problem 2

At 7:15 a boat leaves A and goes downstream, arriving at B at 9:45. Its speed in still water is 21 km/h and the current is 3 km/h. How long is the river stretch AB?

Your work:

Problem 3

A canoe goes 45 km downstream in 1 hour 30 minutes and comes back the same 45 km upstream in 2 hours 15 minutes. Find the speed of the canoe in still water and the speed of the current.

Your work:

Problem 4

A canoe goes downstream from A to B, a distance of 48 km, in 3 hours, and back upstream in 4 hours. How long does a leaf take to float from A to B?

Your work:

Problem 5

A ferry goes downstream at 22 km/h and upstream at 16 km/h. Find its speed in still water and the speed of the current.

Your work:

Problem 6

A boat's speed in still water is 12 km/h and the current flows at 2.5 km/h. How long does the boat take to go 38 km upstream?

Your work:

Problem 7

A boat with speed 18 km/h in still water goes downstream from A to B in 2 hours. The current is 3 km/h. How long does it take to come back from B to A?

Your work:

Problem 8

A raft drifts 7.5 km in 2.5 hours on a river. On the same river a boat whose speed in still water is 15 km/h goes 36 km upstream. How long does the boat take?

Your work:

Problem 9

A motorboat with speed 20 km/h in still water goes downstream from A to B and immediately comes back to A. AB is 48 km and the current is 4 km/h. How long is the whole trip?

Your work:

Problem 10

A boat's downstream speed is 1.5 times its upstream speed. The current flows at 2 km/h. Find the speed of the boat in still water.

Your work:

Problem 11

A boat goes downstream from A to B in 3 hours and back upstream in 4 hours. The current is 2 km/h. How long is AB?

Your work:

Problem 12

A canoe goes downstream from C to D in 2 hours and back upstream in 3 hours. The current is 2.5 km/h. Find the speed of the canoe in still water.

Your work:

Problem 13

A barge takes 5 hours to go downstream from A to B and 7 hours to go back. How long does a log take to drift from A to B?

Your work:

Problem 14

A boat with speed 15 km/h in still water goes downstream from A to B and at once returns to A. The current is 3 km/h and the whole trip takes 5 hours. How long is AB?

Your work:

Problem 15

Nam rows at 4 km/h in still water. On a river with a current of 1 km/h he rows 6 km upstream and then rows back to the start. How long does he take altogether?

Your work:

Problem 16

A train travelling at 72 km/h passes a pole in 9 seconds. How long is the train?

Your work:

Problem 17

A train 240 m long goes past a man standing beside the track in 16 seconds. Find its speed in m/s and in km/h.

Your work:

Problem 18

A train 150 m long runs at 15 m/s. How long does it take to cross a bridge 300 m long?

Your work:

Problem 19

A train running at 54 km/h crosses a bridge 0.6 km long in 48 seconds. How long is the train?

Your work:

Problem 20

A train passes a pole in 10 seconds and crosses a bridge 360 m long in 34 seconds. Find the speed and the length of the train.

Your work:

Problem 21

A train 200 m long runs at 20 m/s through a tunnel 1 km long.

a) How long is it from the moment the head enters the tunnel until the tail leaves it?

b) For how long is the whole train inside the tunnel?

Your work:

Problem 22

A train 180 m long passes a cyclist riding towards it at 18 km/h in 9 seconds. Find the speed of the train in km/h.

Your work:

Problem 23

A train 200 m long overtakes a jogger running at 2 m/s in the same direction. It takes 25 seconds. Find the speed of the train in km/h.

Your work:

Problem 24

A train 120 m long at 54 km/h meets a train 180 m long at 36 km/h coming the other way on a parallel track. How long do they take to pass each other?

Your work:

Problem 25

An express train 160 m long at 20 m/s overtakes a goods train 140 m long at 15 m/s on a parallel track. How long does the overtaking take?

Your work:

Problem 26

A car at 72 km/h drives alongside a train going the same way at 54 km/h. It takes the car 40 seconds to get from the tail to the head of the train. How long is the train?

Your work:

Problem 27

Lan sits by the window of a train running at 15 m/s. A train on the next track, running the other way at 10 m/s, takes 9 seconds to go past her window. How long is that train?

Your work:

Problem 28

A train passes a signal post in 10 seconds and passes along a platform 150 m long in 16 seconds. Find the length and the speed of the train.

Your work:

Problem 29

A train 150 m long runs at 15 m/s and crosses a bridge in 40 seconds. How long is the bridge?

Your work:

Problem 30

A train crosses a bridge 240 m long in 25 seconds and a bridge 420 m long in 37 seconds, at the same speed. Find the speed and the length of the train.

Your work:

Challenge – Extension

Problem 31 *

A boat with speed 18 km/h in still water goes downstream from A to B and at once comes back. The current is 2 km/h and the round trip takes 4 hours 30 minutes. How long is AB?

Your work:

Problem 32 *

Ports A and B are 60 km apart and the river flows from A to B at 3 km/h. At the same moment a boat leaves A for B and another boat leaves B for A; both have speed 20 km/h in still water. After how long do they meet, and how far from A?

Your work:

Problem 33 **

As a boat leaves A downstream, a raft is let go at A. The boat (12 km/h in still water, current 3 km/h) reaches B, 30 km from A, and immediately turns back. How long after leaving A does it meet the raft?

Your work:

Problem 34 ⋆⋆

Rowing upstream, Bình's hat falls into the water. He notices 20 minutes later, turns round at once and picks up his hat 2 km downstream of the place where it fell. Find the speed of the current.

Your work:

Problem 35 ⋆

A ferry goes downstream at 20 km/h and upstream at 12 km/h. It goes from A to B, rests 30 minutes at B and comes back; the whole trip takes 4 hours 30 minutes. How long is AB?

Your work:

Problem 36 ⋆

A boat's speed in still water is 4 times the speed of the current. It goes downstream from A to B in 2 hours. How long does it take to go back?

Your work:

Problem 37 *

A canoe goes downstream from A to B in 3 hours and back in 4 hours 30 minutes. If its engine were switched off, how long would it take to drift from A to B?

Your work:

Problem 38 *

At 7:00 a boat leaves B upstream and reaches A at 10:00. It rests, leaves A at 10:30 and gets back to B at 12:30. The current is 2 km/h. How far is it from A to B?

Your work:

Problem 39 **

At 6:00 a raft starts drifting from A. At 8:00 a boat leaves A downstream (9 km/h in still water). The current is 3 km/h. At what time does the boat catch the raft, and how far from A?

Your work:

Problem 40 **

A train overtakes a man walking in the same direction at 1 m/s in 22 seconds, and passes a man walking towards it at 1 m/s in 18 seconds. Find the speed and the length of the train.

Your work:

Problem 41 ★★

A train goes through a tunnel 1.5 km long. From the moment its head enters until its tail leaves takes 90 seconds; the whole train is inside the tunnel for 60 seconds. Find the speed and the length of the train.

Your work:

Problem 42 ★★

An express train 180 m long runs at 24 m/s. It takes 50 seconds to overtake a slower train on a parallel track; if the two trains ran towards each other they would pass in 10 seconds. Find the speed and the length of the slower train.

Your work:

Problem 43 ★

A passenger on a train running at 54 km/h sees a train 300 m long, coming the other way, go past in 12 seconds. Find the speed of that train in km/h.

Your work:

Problem 44 *

A bridge is 4 times as long as a train. The train, at 20 m/s, takes 25 seconds from the moment its head reaches the bridge until its tail leaves it. Find the length of the train and of the bridge.

Your work:

Problem 45 *

Two trains, each 150 m long, pass each other going in opposite directions in 10 seconds. One train is 1.5 times as fast as the other. Find their speeds.

Your work:

Problem 46 *

Train A, 240 m long, at 72 km/h overtakes train B going the same way at 54 km/h. The overtaking takes 1 minute 30 seconds. How long is train B?

Your work:

Problem 47 **

On a river with a current of 1 m/s, a cargo ship 80 m long sails downstream (6 m/s in still water) and meets a ship 70 m long sailing upstream (4 m/s in still water). How long do they take to pass each other?

Your work:

Problem 48 ★★

A line of pupils 300 m long walks at 1.5 m/s. A cyclist rides at 4.5 m/s from the back of the line to the front and immediately back to the end. How long does this take?

Your work:

Problem 49 ★

A train 250 m long runs at 72 km/h. Its head enters a tunnel at 9:00:00 and its tail leaves at 9:01:40. How long is the tunnel?

Your work:

Problem 50 ★★

A boat's upstream speed is $\frac{2}{3}$ of its downstream speed. A raft drifts from A to B in 30 hours. How long does the boat take from A to B downstream, and from B to A upstream?

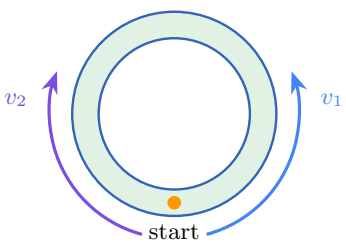

Your work:

10 Motion around a Circular Track

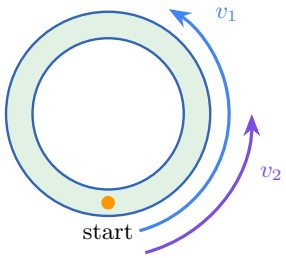

① Moving round a closed track

- Runners on a running track, cyclists round a lake, the hands of a clock… all move round a closed path. After each full lap the mover is back exactly where it started, and it can go round as many times as it likes.
- If one lap is C and the distance travelled is s, then $s : C$ gives the number of whole laps, and the remainder tells us how far past the start the mover is. For a circular track, $C = \text{diameter} \times 3.14$.
- **Careful:** "how far from the start" along the way ahead is *one lap minus the remainder*, not the remainder itself.

② Two movers starting together from the same point

opposite directions
time to meet $= C : (v_1 + v_2)$

same direction $(v_1 > v_2)$
time to meet $= C : (v_1 - v_2)$

- **Opposite directions:** they meet each time that together they have covered one lap.
- **Same direction:** they meet each time the faster one has gained one whole lap on the slower one (it "laps" the slower one).
- After the first meeting the situation repeats: the 2nd, 3rd, … meetings come after 2, 3, … times that time.
- If they do not start together, use the gap between them in place of C for the first meeting.

Clock hands move round the clock face, which has 60 minute-divisions: the minute hand moves 1 division per minute and the hour hand $\frac{1}{12}$ division per minute.

③ Going back and forth on a road

Motion around a Circular Track

Two people start at the same time from the two ends A and B of a road, walk towards each other, and each turns back at once on reaching the other end.

- By the first meeting (at C) together they have covered *one* length AB.
- By the second meeting (at D, after both have turned back) together they have covered *three* lengths AB, so it takes 3 times as long, and each person has walked 3 times as far as before the first meeting.

This holds when the faster person is less than twice as fast as the slower one, so that nobody is caught from behind before the second meeting.

Example 1

Minh and Hà cycle round a lake whose shore path is 1.5 km long. Minh rides at 12 km/h and Hà at 15 km/h. They start together from the same point and go the same way. After how long do they meet for the first time (not counting the start)?

Guided solution.

To meet again, Hà must gain one whole lap, 1.5 km, on Minh.
Difference of speeds: $15 - 12 = 3$ (km/h).
Time: $1.5 : 3 = 0.5$ (h) $= 30$ min.
Answer: 30 minutes.

Example 2

On a 400 m running track, Tú runs at 3 m/s and Quân at 5 m/s. They start together from the same point and run in opposite directions.

a) After how long do they first meet?

b) How far from the start is that, along Tú's way?

c) How many times do they meet in 10 minutes?

Guided solution.

a) Together they cover one lap: $400 : (3 + 5) = 50$ (s).

b) In 50 s Tú runs $3 \times 50 = 150$ (m): they meet 150 m from the start along Tú's way (and 250 m along Quân's way).

c) 10 min $= 600$ s; they meet every 50 s, so $600 : 50 = 12$ times.

Answer: a) 50 s; **b)** 150 m; **c)** 12 times.

Example 3

Dũng jogs from his house round a block whose loop is 1.8 km long, at 8 km/h. After 45 minutes, how much farther must he run, keeping the same way, to get back home?

Guided solution.

45 min = 0.75 h; distance run: $8 \times 0.75 = 6$ (km).

$6 : 1.8 = 3$ laps, remainder 0.6 km ($6 = 3 \times 1.8 + 0.6$): Dũng is 0.6 km past his house.

To get home going forward he still needs $1.8 - 0.6 = 1.2$ (km).

Do not answer 0.6 *km: that is how far he has gone* past *the house, not how far he still has to go.*

Answer: 1.2 km.

Example 4

A circular running track has diameter 100 m. Two pupils start together from the same point and run the same way at 4.5 m/s and 2.5 m/s. After how long does the faster one first catch the slower one?

Guided solution.

Length of one lap: $100 \times 3.14 = 314$ (m).

Difference of speeds: $4.5 - 2.5 = 2$ (m/s).

Time: $314 : 2 = 157$ (s) = 2 min 37 s.

Answer: 2 minutes 37 seconds.

Example 5

Two friends set off at the same time, one from A towards B and one from B towards A. They meet first at C, 14 km from A. Each goes on to the other end and turns back at once; they meet a second time at D, 8 km from B. How long is the road AB?

Guided solution.

By the first meeting the two together have covered one AB; the friend from A has walked 14 km. By the second meeting they together have covered three AB, so the friend from A has walked $14 \times 3 = 42$ (km).

He walked from A to B and then 8 km back: $42 = AB + 8$, so $AB = 42 - 8 = 34$ (km).

Check: the speeds are in the ratio $14 : 20$*; the friend from B walks* $20 \times 3 = 60 = 34 + 26$ *km, i.e. to A and* 26 *km back, which is* 8 *km from B.*

Answer: 34 km.

Practice

Problem 1

On a 400 m track two runners start together from the same point and run in opposite directions at 4 m/s and 6 m/s. After how long do they first meet?

Your work:

Problem 2

The same two runners (at 4 m/s and 6 m/s) start together from the same point on the 400 m track but run the same way. After how long do they first meet?

Your work:

Problem 3

A lake path is 3 km round. Two cyclists start together from the same point in opposite directions at 12 km/h and 18 km/h. After how many minutes do they meet?

Your work:

Problem 4

The two cyclists of Problem 3 now ride the same way round the 3 km lake. After how long does the faster one first catch up with the other?

Your work:

Problem 5

A park path is a loop of 900 m. Lan walks at 60 m/min and Mai at 90 m/min; they start together from the gate and walk the same way. After how long does Mai first catch up with Lan, and how many laps has each walked by then?

Your work:

Problem 6

An runs round an 800 m track at 150 m/min for 14 minutes. How many full laps has he run, and how many more metres must he run to finish the lap he is on?

Your work:

Problem 7

A circular cycle track has diameter 50 m. A child rides 5 laps. How far does the child ride?

Your work:

Problem 8

A circular track has diameter 100 m. Two pupils start together from the same point and run in opposite directions at 3 m/s and 5 m/s. After how long do they meet?

Your work:

Problem 9

Two cyclists ride the same way round a 2 km circuit at 20 km/h and 25 km/h, starting together. How many times does the faster one overtake the slower one in 2 hours?

Your work:

Problem 10

Two runners start together from the same point of a 500 m track and run in opposite directions at 3 m/s and 2 m/s. How many times do they meet in 10 minutes?

Your work:

Problem 11

Two friends run the same way round a 1 km loop, starting together. The faster one runs at 250 m/min and catches the other for the first time after 10 minutes. Find the speed of the slower one.

Your work:

Problem 12

Two friends run in opposite directions round a 600 m loop, starting together, and meet after 2 minutes. One runs at 140 m/min. Find the speed of the other.

Your work:

Problem 13

On a 400 m track, Bảo starts 100 m ahead of Khoa, and both run the same way. Khoa runs at 5 m/s, Bảo at 3 m/s. After how long does Khoa catch Bảo?

Your work:

Problem 14

Hùng runs one lap of a track in 4 minutes, Việt in 6 minutes. They start together from the same point and run the same way. After how long does Hùng first catch Việt?

Your work:

Problem 15

Hùng and Việt (one lap in 4 min and in 6 min) now start together and run in opposite directions. After how long do they meet?

Your work:

Problem 16

One runner takes 3 minutes per lap and another 5 minutes per lap. They start together from the start line. After how long are both at the start line together again for the first time?

Your work:

Problem 17

A runner runs 5 laps of a 400 m track in 10 minutes. Find the speed in m/min and in km/h.

Your work:

Problem 18

A road AB is 30 km long. A cyclist leaves A for B at 12 km/h, and at the same time a motorcyclist leaves B for A at 18 km/h. Each turns back at once on reaching the other end.

a) How far from A do they meet the first time?

b) How far from A do they meet the second time?

Your work:

Problem 19

Two people set off at the same time from A and from B towards each other. They meet first 9 km from A. Each goes on to the other end and turns back at once; they meet again 5 km from B. How long is AB?

Your work:

Problem 20

Hoa walks from A and Quế from B towards each other, then back and forth between A and B without stopping. Their speeds are in the ratio 2 : 3. The first two meeting points are 24 m apart. How long is AB?

Your work:

Problem 21

A bicycle wheel has diameter 0.6 m. How many turns does it make while the bicycle travels 942 m?

Your work:

Problem 22

The minute hand of a clock is 10 cm long. How far does its tip travel in 1 hour? In 3 hours?

Your work:

Problem 23

On a 400 m track, A runs at 6 m/s and B at 4 m/s, the same way, starting together. When A first laps B, how many metres and how many laps has A run?

Your work:

Problem 24

Phúc runs one lap of a track in 80 seconds and Long in 120 seconds. They start together and run in opposite directions. After how long do they meet?

Your work:

Problem 25

Two horses gallop the same way round a 1.2 km racecourse at 15 m/s and 12 m/s, starting together. After how long does the faster one first catch the other?

Your work:

Problem 26

Two toy trains run in opposite directions round a circular track 3 m long, at 0.25 m/s and 0.35 m/s, starting from the same point. After how long do they meet?

Your work:

Problem 27

Two runners start together and run in opposite directions at 4 m/s and 6 m/s round a track. They meet after 40 seconds. How long is the track?

Your work:

Problem 28

Two cyclists start together and ride the same way at 260 m/min and 180 m/min round a loop. The faster first catches the slower after 6 minutes. How long is the loop?

Your work:

Problem 29

Ngân starts from home and runs round a 2.5 km loop at 9 km/h for 1 hour. How much farther must she run, keeping the same way, to get back home?

Your work:

Problem 30

Two swimmers start at the same time from the two ends of a 50 m pool and swim back and forth at 1 m/s and 1.5 m/s, turning at once at each end. After how long do they meet the first time? The second time?

Your work:

Challenge – Extension

Problem 31 ⋆

Three children run the same way round a 300 m track at 3 m/s, 4 m/s and 5 m/s, starting together from the same point. After how long are all three together again for the first time?

Your work:

Problem 32 ⋆

On a 400 m track two runners start together the same way at 4 m/s and 5 m/s. After how long are they both at the start line together for the first time? Is that also the first time they meet?

Your work:

Problem 33 ★★

On a 400 m track two runners start together from point S and run in opposite directions at 3 m/s and 5 m/s. At which meeting do they meet at S again for the first time, and when?

Your work:

Problem 34 ★★

At exactly 3 o'clock, after how many minutes are the hour hand and the minute hand of a clock on top of each other for the first time?

Your work:

Problem 35 ★★

How many times are the two hands of a clock on top of each other from just after 12 noon until 12 midnight (including midnight)?

Your work:

Problem 36 *

On a 600 m track, B starts 200 m ahead of A and both run the same way, A at 5 m/s and B at 3 m/s. When does A catch B the first time? The second time?

Your work:

Problem 37 *

On a 400 m track, two runners starting together meet after 40 s if they run in opposite directions, and after 200 s if they run the same way. Find their speeds.

Your work:

Problem 38 **

Yến runs one lap of a track in 6 minutes. Running in opposite directions from the same start, she and Xuân meet every 2 minutes 24 seconds. How long does Xuân take for one lap?

Your work:

Problem 39 **

Two friends 6 km apart walk towards each other at 3 km/h and 5 km/h. A dog starts with the first friend and runs at 12 km/h back and forth between them until they meet. How far does the

dog run?

Your work:

Problem 40 ★★

Hà walks back and forth between A and B, starting from A; Tú does the same starting from B at the same moment. Hà's speed is 80% of Tú's. The first two meeting points are 40 m apart. How long is AB?

Your work:

Problem 41 ★★

Two cars leave A and B at the same time towards each other. They meet first 40 km from A. Each drives on to the other end and turns back at once; they meet the second time 20 km from A. How long is AB?

Your work:

Problem 42 ★

On a 500 m track, Kiên (at 3 m/s) and Lâm (at 2 m/s) start together from S and run in opposite directions. When do they meet the third time, and how far from S is that along Kiên's way?

Your work:

Problem 43

On a 400 m track, A runs at 5 m/s and B more slowly, the same way, starting together. A first laps B at the moment A finishes his 5th lap. Find B's speed.

Your work:

Problem 44

On a 400 m track, two runners start together from S in opposite directions and meet at a point 160 m from S along the first runner's way. The first runner runs at 4 m/s. Find the speed of the second.

Your work:

Problem 45

A Ferris wheel has diameter 40 m and turns once every 8 minutes. How fast does a cabin on its rim move (in m/min)?

Your work:

Problem 46

A bicycle wheel of diameter 0.5 m turns 200 times a minute. Find the speed of the bicycle in km/h.

Your work:

Problem 47 ⋆

Two runners start at the same moment from two opposite points of a 400 m track (half a lap apart) and run the same way at 6 m/s and 4 m/s. After how long does the faster one catch the slower one?

Your work:

Problem 48 ⋆⋆

Two runners start at the same moment from two opposite points of a 400 m track and run towards each other at 3 m/s and 5 m/s. When do they meet the third time?

Your work:

Problem 49 ⋆

Two friends walk from the two ends of a 1.2 km path towards each other at 70 m/min and 50 m/min, then go on back and forth without stopping. How long after the start do they meet the second time?

Your work:

Problem 50 ⋆⋆

Two runners start together from the same point of a track. Running in opposite directions they meet every 30 s; running the same way, the faster one laps the slower every 2 min 30 s. How long does each take for one lap?

Your work:

11 Statistics and Probability

① Collecting and presenting data

To compare, judge and decide, people **collect information** (data) and then **organise** it. Sometimes we ask everybody; sometimes we ask only a typical group.

Data are usually shown as:

- a **table** – each value is written in its own cell;
- a **pictograph** – each picture stands for the same number of things;
- a **bar chart** – the height of each bar, read on the vertical scale, gives the value;
- a **pie chart** – the whole circle is the whole total (100%); each slice is a percentage of the total. Half the circle is 50%, a quarter is 25%.

From a pie chart: **part** = **total** : 100× **percentage**; **total** = **part** : **percentage** ×100.

② The mean (average)

Mean = (sum of the values) : (number of values). **Sum** = mean × number of values.

- The mean always lies between the smallest and the largest value.
- To find a *missing value*: work out the sum from the mean, then subtract the values you know.
- If one value grows by some amount, the sum grows by that amount and the mean grows by (that amount) : (number of values).

③ Chance and counting outcomes

When we repeat an experiment (tossing a coin, rolling a dice, spinning a spinner, picking a ball without looking), we record how many times each outcome happens.

$$\textbf{ratio describing how often an outcome happened} = \frac{\text{number of times it happened}}{\text{total number of trials}}$$

For example, a dice is rolled 20 times and the face with 6 dots comes up 3 times: the ratio is $\frac{3}{20}$.

If we roll more times, this ratio may change.

Counting outcomes. List every possible result in an orderly way (a list, a table or a tree). A

coin has 2 outcomes, a dice has 6; a coin *and* a dice together have $2 \times 6 = 12$.
When all outcomes are *equally likely*, the **chance** of an event = (number of outcomes that give the event) : (number of all outcomes). An event that always happens is *certain*; one that can never happen is *impossible*.

Example 1

Lan writes down how many pages she reads each day of one week:

Day	Mon	Tue	Wed	Thu	Fri	Sat	Sun
Pages	18	25	20	32	15	30	28

a) On which day did she read most? Least?

b) How many pages did she read per day on average?

c) On how many days did she read more than her average?

Guided solution.

a) Most on Thursday (32 pages); least on Friday (15 pages).

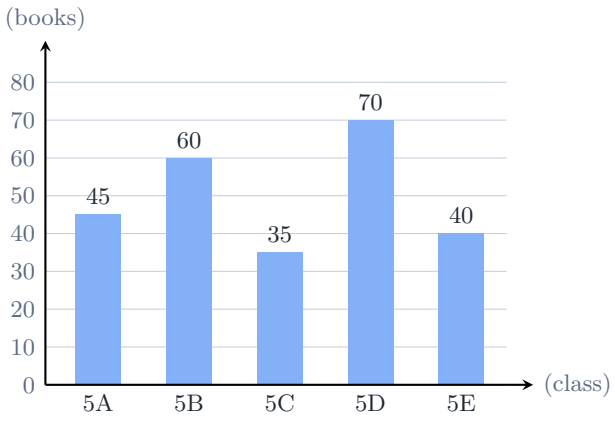

b) Pages in the week: $18 + 25 + 20 + 32 + 15 + 30 + 28 = 168$.
Mean per day: $168 : 7 = 24$ pages.

c) More than 24: Tuesday, Thursday, Saturday and Sunday, i.e. 4 days.

Answer: a) Thursday; Friday. **b)** 24 pages. **c)** 4 days.

Example 2

The bar chart shows how many books five classes gave to the school library.

a) How many books did the five classes give? **b)** How many books did a class give on average?

c) How many more books did the class that gave most give than the class that gave least?

Guided solution.

a) $45 + 60 + 35 + 70 + 40 = 250$ books.

b) $250 : 5 = 50$ books.

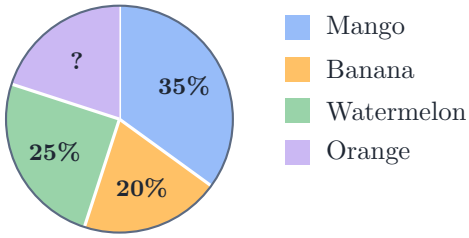

c) Most: 5D (70); least: 5C (35).

Difference: $70 - 35 = 35$ books.

Answer: a) 250 books. **b)** 50 books. **c)** 35 books.

Example 3

400 pupils were asked about their favourite fruit. The results are shown in the pie chart.

a) What percentage of the pupils chose oranges?

b) How many pupils chose mangoes?

c) How many more pupils chose mangoes than bananas?

Guided solution.

a) The whole circle is 100%: $100\% - 35\% - 20\% - 25\% = 20\%$.

b) $400 : 100 \times 35 = 140$ pupils.

c) *Method 1.* Bananas: $400 : 100 \times 20 = 80$ pupils; $140 - 80 = 60$ pupils.

Method 2. Mangoes are $35\% - 20\% = 15\%$ more; $400 : 100 \times 15 = 60$ pupils.

Answer: a) 20%. **b)** 140 pupils. **c)** 60 pupils.

Example 4

Minh rolls a dice 40 times and records the results.

Outcome	1 dot	2 dots	3 dots	4 dots	5 dots	6 dots
Times	6	8	5	7	9	5

Write the ratio describing how often each event happened, compared with the number of rolls:

a) 6 dots; **b)** an even number of dots; **c)** at least 5 dots.

Guided solution.

a) 6 dots came up 5 times: $\frac{5}{40} = \frac{1}{8}$.

b) Even (2, 4, 6 dots): $8 + 7 + 5 = 20$ times; $\frac{20}{40} = \frac{1}{2}$.

c) At least 5 dots (5 or 6 dots): $9 + 5 = 14$ times; $\frac{14}{40} = \frac{7}{20}$.

This does not mean the same thing will happen next time: with more rolls the ratios change.

Answer: a) $\frac{1}{8}$. **b)** $\frac{1}{2}$. **c)** $\frac{7}{20}$.

Example 5

Box I holds three cards numbered 1, 2, 3; box II holds two cards numbered 4, 5. Without looking, Hoa takes one card from each box and adds the two numbers.

a) List all possible outcomes. **b)** What is the chance that the sum is 7?

Guided solution.

a) Make a table (row: box I, column: box II):

+	4	5
1	5	6
2	6	7
3	7	8

There are $3 \times 2 = 6$ equally likely outcomes: $1 + 4,\ 1 + 5,\ 2 + 4,\ 2 + 5,\ 3 + 4,\ 3 + 5$.

b) The sum is 7 in 2 outcomes ($2 + 5$ and $3 + 4$).

Chance: $\frac{2}{6} = \frac{1}{3}$.

Answer: a) 6 outcomes. **b)** $\frac{1}{3}$.

Practice

Problem 1

The noon temperature in a town on five days was:

Day	Mon	Tue	Wed	Thu	Fri
Temperature (°C)	31	29	33	30	32

a) Which day was hottest, which coolest? **b)** Find the mean noon temperature.

Your work:

Problem 2

Nam's marks in six maths tests were 7, 9, 8, 10, 6, 8. What is his mean mark?

Your work:

Problem 3

Four friends are 135 cm, 142 cm, 138 cm and 145 cm tall. Find their mean height.

Your work:

Problem 4

The pictograph shows how many books four groups read in May.

Group 1	📘📘📘📘📘
Group 2	📘📘📘
Group 3	📘📘📘📘📘📘
Group 4	📘📘📘📘

Each 📘 stands for 4 books.

a) How many books did the four groups read? **b)** How many books did a group read on average?

Your work:

Problem 5

A shop sold 24 bicycles in January, 30 in February, 27 in March and 39 in April.

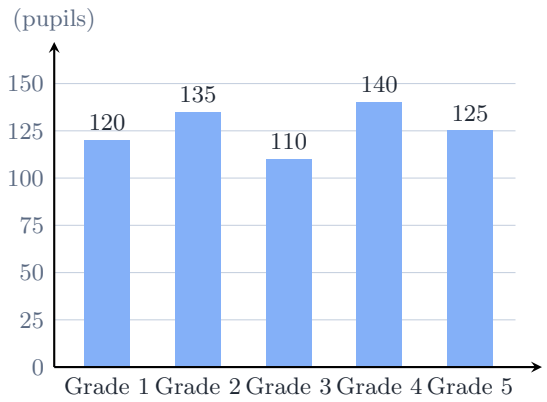

a) How many bicycles were sold in the four months? **b)** How many a month on average?

c) In how many months did the shop sell more than its average?

Your work:

Problem 6

The chart shows the number of pupils in each grade of a primary school.

a) Which grade has the most pupils? The fewest?

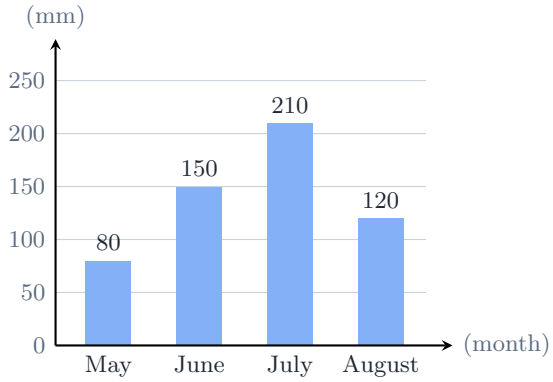

b) How many pupils does the school have?

c) How many more pupils does Grade 4 have than Grade 3?

Your work:

Problem 7

The chart shows the rainfall in a town from May to August.

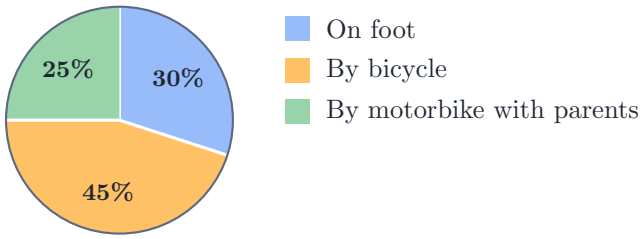

Find the total rainfall and the mean rainfall per month.

Your work:

Problem 8

Class 5B has 40 pupils. The pie chart shows how they come to school.

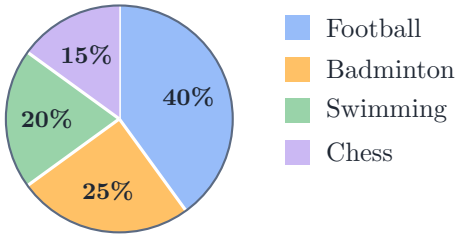

a) How many pupils walk to school?

b) How many more pupils come by bicycle than by motorbike?

Your work:

Problem 9

200 pupils chose their favourite sport.

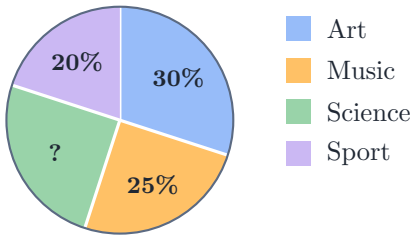

a) How many pupils chose football? **b)** chess?

c) How many pupils chose football or swimming?

Your work:

Problem 10

300 pupils each joined one after-school club.

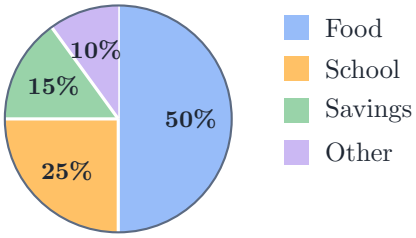

What percentage of the pupils joined the Science club, and how many pupils is that?

Your work:

Problem 11

A family spends 12 000 000 dong a month as the chart shows.

How much money goes on food? How much is saved?

Your work:

Problem 12

In a survey, 36 pupils chose mango as their favourite fruit. They are 30% of all the pupils asked. How many pupils were asked?

Your work:

Problem 13

The mean of five numbers is 18. Four of them are 15, 20, 17 and 22. Find the fifth number.

Your work:

Problem 14

An's mean mark in three tests is 8. After a fourth test his mean mark is 8.5. What did he get in the fourth test?

Your work:

Problem 15

Three bags of rice weigh 25 kg on average. A fourth bag of 33 kg is added. What is the mean weight of the four bags?

Your work:

Problem 16

Tú tosses a coin 50 times; it lands heads up 28 times. Write the ratio describing how often it landed heads, and how often tails, compared with the number of tosses.

Your work:

Problem 17

A spinner with red, blue and yellow parts is spun 60 times: red 21 times, blue 15 times, yellow 24 times.

a) Write the ratio for each colour. **b)** Write the ratio for "not red".

Your work:

Problem 18

A dice is rolled 30 times:

Outcome	1 dot	2 dots	3 dots	4 dots	5 dots	6 dots
Times	4	6	5	3	7	5

Write the ratio for: **a)** an odd number of dots; **b)** more than 4 dots.

Your work:

Problem 19

Bình rolls a dice many times. The face with 6 dots comes up 9 times, and the ratio for 6 dots is $\frac{3}{20}$. How many times did Bình roll the dice? How many rolls did not show 6 dots?

Your work:

Problem 20

A bag holds red and blue balls. Mai takes a ball without looking, writes its colour and puts it

back. She does this 25 times, and the ratio for red is $\frac{2}{5}$. How many times did she get red, and how many times blue?

Your work:

Problem 21

Two coins are tossed at the same time.
a) List all possible outcomes. **b)** In how many outcomes is there one head and one tail?

Your work:

Problem 22

A school canteen offers 3 main dishes (rice, noodles, bread) and 2 drinks (milk, juice). A lunch is one main dish and one drink. How many different lunches are there? List them.

Your work:

Problem 23

Using the digits 1, 4, 7, how many two-digit numbers with two different digits can be written? How many of them are even?

Your work:

Problem 24

A bag holds 3 red, 5 blue and 2 yellow balls of the same size. One ball is taken without looking.

a) Which colour is most likely? **b)** What is the chance of a blue ball?

c) Is a green ball certain, possible or impossible?

Your work:

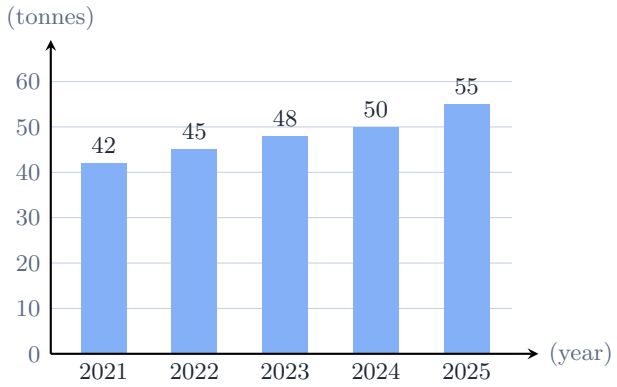

Problem 25

A football team scored 2, 0, 3, 1, 4, 2, 1, 3 goals in eight matches. Find the mean number of goals per match. In how many matches did the team score more than the mean?

Your work:

Problem 26

The chart shows the rice harvest of a farm (in tonnes).

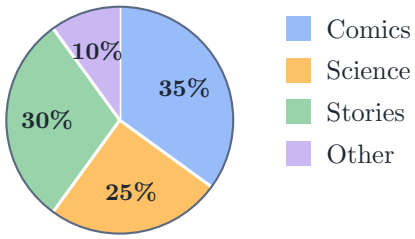

a) Find the mean harvest per year. **b)** How much more was harvested in 2025 than in 2021?

Your work:

Problem 27

A library has 1 200 books.

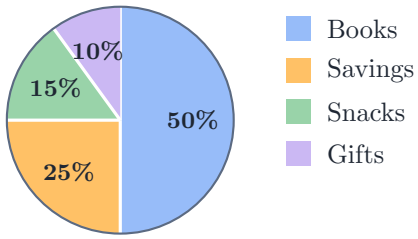

a) How many science books are there? **b)** How many more story books than "other" books?

Your work:

Problem 28

Hoa spent her 160 000 dong of pocket money as shown.

a) How much did she save? **b)** How much more did she spend on books than on snacks?

Your work:

Problem 29

Five girls weigh 32 kg on average and three boys weigh 36 kg on average. Find the mean weight of all eight children.

Your work:

Problem 30

Lan tosses a coin several times. It lands tails up 14 times, and the ratio for heads is $\frac{3}{5}$. How many times did she toss the coin, and how many heads were there?

Your work:

Challenge – Extension

Problem 31

The mean of six numbers is 15. When one number is removed, the mean of the other five is 14. Which number was removed?

Your work:

Problem 32

The mean age of 10 players in a team is 30. When the coach is counted too, the mean age is 31. How old is the coach?

Your work:

Problem 33

Hùng's mean mark in four tests is 7.5. What must he get in the fifth test so that his mean mark becomes 8?

Your work:

Problem 34

The mean of three numbers is 35. The first is twice the second, and the second is twice the third. Find the three numbers.

Your work:

Problem 35

The mean of five consecutive even numbers is 36. Find the largest of them.

Your work:

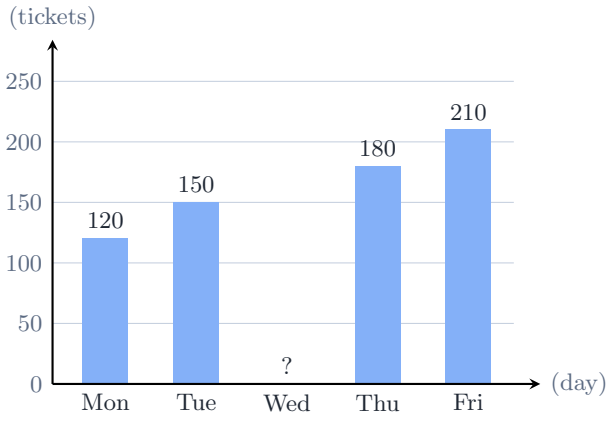

Problem 36

The mean of four marks was worked out as 8.25, but one mark was copied as 6 instead of 9. What is the correct mean?

Your work:

Problem 37

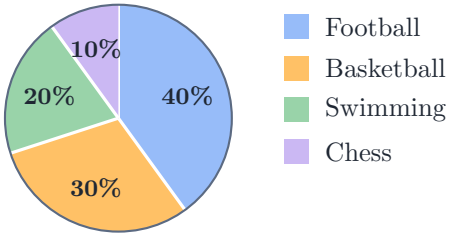

The chart shows tickets sold at a museum from Monday to Friday; the bar for Wednesday is missing. The mean is 160 tickets a day. How many tickets were sold on Wednesday?

Your work:

Problem 38 *

Each pupil of class 5A chose one sport. 12 pupils chose basketball.

a) How many pupils are there in class 5A? **b)** How many chose football? Chess?

Your work:

Problem 39 **

160 pupils named their favourite pet: dog 40%, rabbit 15%, and the rest chose cat or fish. Twice as many pupils chose cats as chose fish. How many pupils chose cats?

Your work:

Problem 40 *

In class 5A (40 pupils), 35% like reading best. In class 5B (36 pupils), 50% like reading best. Which class has more pupils who like reading best, and by how many?

Your work:

Problem 41 *

Using the digits 0, 3, 5, 8, how many two-digit numbers with different digits can be written? How many of them are divisible by 5?

Your work:

Problem 42 *

Six friends meet, and every two of them shake hands once. How many handshakes are there?

Your work:

Problem 43 **

Two dice are rolled together and the dots are added.

a) How many outcomes are there? **b)** In how many outcomes is the sum 7? What is the chance of a sum of 7?

c) What is the chance of a sum of 12?

Your work:

Problem 44 *

A box holds 4 red and 6 blue balls. **a)** What is the chance of taking a red ball without looking?

b) How many red balls must be added so that the chance of red becomes $\frac{1}{2}$?

Your work:

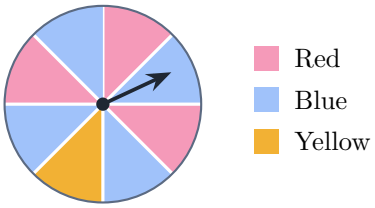

Problem 45

A bag holds 20 red, blue and green balls. The chance of a red ball is $\frac{1}{4}$ and the chance of a blue ball is $\frac{2}{5}$. How many balls of each colour are there?

Your work:

Problem 46

A spinner is divided into 8 equal parts: 3 red, 4 blue and 1 yellow.

a) What is the chance that the arrow stops on blue? **b)** About how many times would you expect blue in 80 spins?

Your work:

Problem 47

The mean age of a family of four is 24 years now. What was their mean age 4 years ago (all four were already born then)?

Your work:

Problem 48

In a test, the 32 pupils of a class have a mean mark of 8. The 20 girls have a mean mark of 8.3. Find the mean mark of the boys.

Your work:

Problem 49

A box holds 12 balls, some red and some white. Nam takes a ball, notes its colour and puts it back, 60 times; red comes up 45 times. About how many red balls are there in the box?

Your work:

Problem 50

An, Bình and Chi stand in a row for a photo.

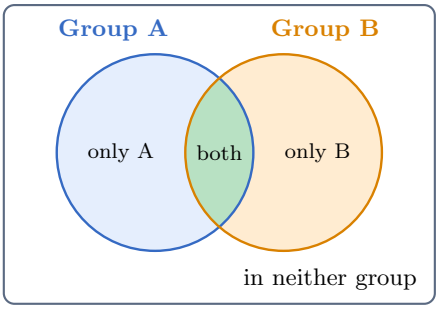

a) In how many different orders can they stand? **b)** In how many of them is An in the middle?

Your work:

12 Venn Diagrams, Working Back

① Venn diagrams with two circles

A **Venn diagram** shows groups as closed curves (circles) inside a rectangle that stands for everybody.

- The *overlap* of the two circles holds those who belong to **both** groups.
- The rest of each circle holds those who belong to **only** that group.
- Inside the rectangle but outside both circles are those who belong to **neither** group.

When we add A + B, the members of both groups are counted *twice*. So:

$$\begin{aligned} \textbf{at least one group} &= \text{A} + \text{B} - \text{both} \\ \textbf{both} &= \text{A} + \text{B} - (\text{at least one group}) \\ \textbf{only A} &= \text{A} - \text{both} \\ \textbf{neither} &= \text{everybody} - (\text{at least one group}) \end{aligned}$$

② Venn diagrams with three circles

Three circles A, B, C make 7 regions inside them (plus the region outside). Fill in the diagram **from the centre outwards**:

1. the centre: those in all three groups;
2. each overlap of two circles: (in both groups) − (in all three);
3. each "only" region: (whole circle) − (the three numbers already written in it).

Adding all the regions gives the number in at least one group. In one line:

$$\text{at least one} = \text{A} + \text{B} + \text{C} - (\text{A and B}) - (\text{B and C}) - (\text{C and A}) + (\text{all three}).$$

③ Working backwards with a table

When things are passed from one person (or box) to another several times and we know the **final** result, we work **backwards** from the end:

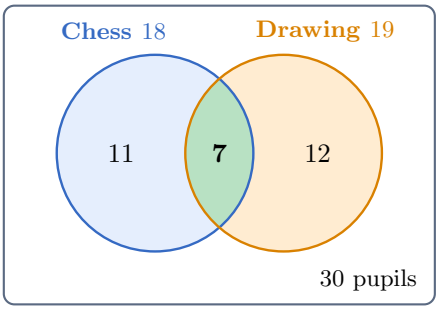

- Passing things around does *not* change the total. If at the end everyone has the same, each has total : number of people.
- Undo the steps in reverse order: whoever *gave* gets the amount back (+), whoever *received* gives it back (−).
- "Gives as many as the other already has" makes the receiver's amount *double*; going back we *halve* it.
- A **table** with one row for each moment keeps the work tidy. Check by working forwards.

Example 1

A group of 30 pupils each joins at least one of two clubs: 18 join the Chess club and 19 join the Drawing club. How many pupils join both clubs? How many join only one club?

Guided solution.

Adding $18 + 19 = 37$ counts the pupils in both clubs twice, so
both clubs: $37 - 30 = 7$ pupils.
Only Chess: $18 - 7 = 11$; only Drawing: $19 - 7 = 12$; only one club: $11 + 12 = 23$ pupils.

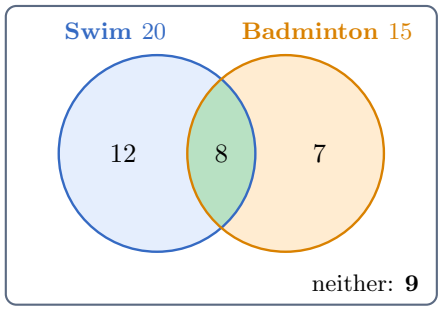

Answer: 7 pupils; 23 pupils.

Example 2

Class 5C has 36 pupils. 20 pupils can swim, 15 can play badminton and 8 can do both. How many pupils can do neither?

Guided solution.

Method 1. At least one: $20 + 15 - 8 = 27$ pupils.
Neither: $36 - 27 = 9$ pupils.
Method 2. Only swim: $20 - 8 = 12$; only badminton: $15 - 8 = 7$.
At least one: $12 + 7 + 8 = 27$; neither: $36 - 27 = 9$.

Answer: 9 pupils.

Example 3

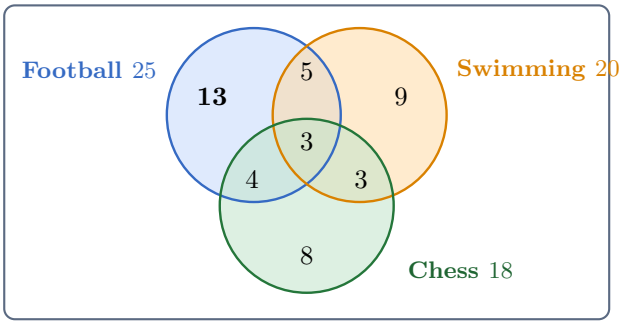

Every pupil in a group likes at least one of football, swimming and chess. 25 like football, 20 like swimming and 18 like chess; 8 like football and swimming, 6 like swimming and chess, 7 like football and chess, and 3 like all three.

a) How many like only football? **b)** How many pupils are in the group?

Guided solution.

Fill in from the centre: all three: 3.
Football and swimming only: $8 - 3 = 5$; swimming and chess only: $6 - 3 = 3$; football and chess only: $7 - 3 = 4$.

a) Only football: $25 - 5 - 4 - 3 = 13$.
Only swimming: $20 - 5 - 3 - 3 = 9$; only chess: $18 - 4 - 3 - 3 = 8$.

b) $13 + 9 + 8 + 5 + 4 + 3 + 3 = 45$ pupils.
(Check: $25 + 20 + 18 - 8 - 6 - 7 + 3 = 45$.)

Answer: a) 13 pupils. **b)** 45 pupils.

Example 4

An, Bình and Chi have 75 stickers altogether. An gives Bình 6 stickers, then Bình gives Chi 9 stickers, then Chi gives An 4 stickers. Now the three have the same number. How many stickers did each have at first?

Guided solution.

The total stays 75, so at the end each has $75 : 3 = 25$ stickers. Work backwards, one row per step:

	An	Bình	Chi
At the end	25	25	25
Before "Chi gives An 4"	$25 - 4 = 21$	25	$25 + 4 = 29$
Before "Bình gives Chi 9"	21	$25 + 9 = 34$	$29 - 9 = 20$
Before "An gives Bình 6" (at first)	$21 + 6 = \mathbf{27}$	$34 - 6 = \mathbf{28}$	**20**

Check: $27 + 28 + 20 = 75$.

Answer: An 27, Bình 28, Chi 20 stickers.

Example 5

Lan, Mai and Cúc have 120 shells. First Lan gives Mai and Cúc each as many shells as each of them already has. Then Mai does the same for Lan and Cúc, and finally Cúc does the same for Lan and Mai. Now all three have the same number. How many shells did each have at first?

Guided solution.

At the end each has $120 : 3 = 40$. Each time, the two receivers *double*; going back we halve them, and the giver gets back what they received.

	Lan	Mai	Cúc
At the end	40	40	40
Before Cúc gives	20	20	$40 + 20 + 20 = 80$
Before Mai gives	10	$20 + 10 + 40 = 70$	40
At first (before Lan gives)	$10 + 35 + 20 = \mathbf{65}$	**35**	**20**

Check forwards: $(65, 35, 20) \to (10, 70, 40) \to (20, 20, 80) \to (40, 40, 40)$.

Answer: Lan 65, Mai 35, Cúc 20 shells.

Practice

Problem 1

Every pupil of class 5A got at least one mark 10 in Maths or Vietnamese. 21 pupils got a 10 in Maths, 17 in Vietnamese, and 6 got a 10 in both. How many pupils are there in class 5A?

Your work:

Problem 2

Each of 40 pupils likes reading or drawing (or both). 28 like reading and 22 like drawing. How many like both?

Your work:

Problem 3

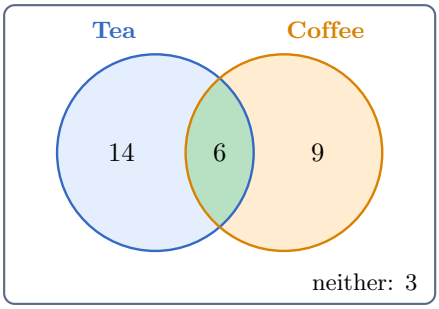

In a group of 45 tourists, 30 speak English, 20 speak French and 5 speak neither language.

a) How many speak both? **b)** How many speak only English? **c)** only French?

Your work:

Problem 4

The Venn diagram shows what the people at a party drink.

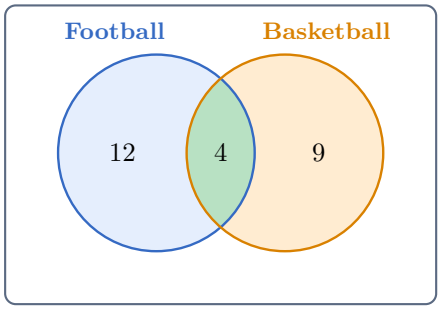

a) How many drink tea? **b)** How many drink coffee? **c)** How many people are at the party?

Your work:

Problem 5

Each member of a sports team plays football or basketball (or both), as the diagram shows.

a) How many members does the team have? **b)** How many play basketball?

Your work:

Problem 6

A maths team of 20 pupils is given two hard problems; everybody solves at least one. 3 pupils cannot solve problem 1 and 5 cannot solve problem 2. How many solve both problems?

Your work:

Problem 7

Class 5D has 38 pupils. 15 sign up for swimming, 20 for football and 7 for both. How many sign up for neither?

Your work:

Problem 8

In a class of 35 pupils, 14 have a dog, 11 have a cat and 5 have both. How many pupils have neither a dog nor a cat?

Your work:

Problem 9

In a village, 60 families were asked: 42 have a television, 35 have a computer, and every family has at least one of them.

a) How many have both? **b)** only a television? **c)** only a computer?

Your work:

Problem 10

How many of the numbers from 1 to 30 are divisible by 2 or by 3?

Your work:

Problem 11

How many of the numbers from 1 to 50 are divisible neither by 2 nor by 5?

Your work:

Problem 12

In a music group, 16 pupils play the piano, 10 play the guitar, and 22 pupils play at least one of them. How many play both? How many play only the piano?

Your work:

Problem 13

18 pupils of a class entered the singing contest, 13 entered the drawing contest, and 25 pupils entered at least one contest. How many pupils entered exactly one contest?

Your work:

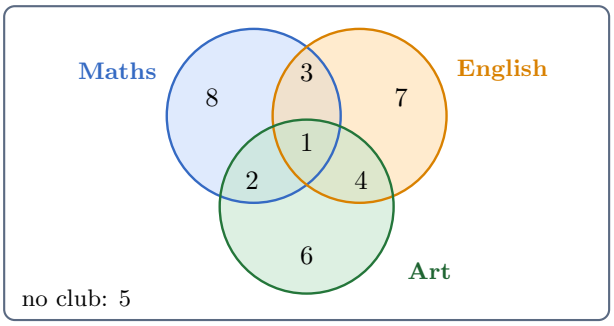

Problem 14

100 pupils were asked about breakfast: 58 like phở, 47 like bánh mì and 15 like neither. How many like both?

Your work:

Problem 15

The diagram shows how many pupils of a class are in the Maths, English and Art clubs.

a) How many pupils are in the Maths club? **b)** How many are in exactly one club?

c) How many pupils are there in the class?

Your work:

Problem 16

Every pupil of a contest team takes at least one of Maths, English and Art: 25 take Maths, 20 take English and 15 take Art. 6 take Maths and English, 4 take English and Art, 5 take Maths and Art, and nobody takes all three. How many pupils are in the team?

Your work:

Problem 17

40 pupils were asked about fruit: 20 like apples, 18 bananas, 16 oranges; 7 like apples and bananas, 6 bananas and oranges, 5 apples and oranges, and 2 like all three. How many pupils like none of the three?

Your work:

Problem 18

In a class of 30, 15 like singing, 12 dancing and 10 drawing; 5 like singing and dancing, 4 dancing and drawing, 3 singing and drawing, and 1 likes all three.

a) How many like only singing? **b)** How many like none of them?

Your work:

Problem 19

In a group, twice as many pupils like football as like volleyball. 6 pupils like both, and 30 pupils like at least one of the two games. How many like football and how many like volleyball?

Your work:

Problem 20

An, Bình and Cường have 60 marbles. An gives Bình 5 marbles, Bình gives Cường 8, then Cường gives An 3. Now they all have the same number. How many did each have at first?

Your work:

Problem 21

Two boxes hold 48 pens. After 7 pens are moved from box A to box B, the two boxes hold the same number. How many pens were in each box at first?

Your work:

Problem 22

Three shelves hold 90 books. 8 books are moved from shelf I to shelf II, then 12 from shelf II to shelf III, then 5 from shelf III to shelf I. Now the shelves hold the same number. How many books were on each shelf at first?

Your work:

Problem 23

Hà gives Lan 4 stickers, and then Lan gives Hà 10 stickers. Now Hà has 26 and Lan has 18. How many did each have at first?

Your work:

Problem 24

From basket A, Mum moves into basket B as many oranges as basket B already has. Now each basket holds 30 oranges. How many were in each basket at first?

Your work:

Problem 25

Two tanks hold 80 litres of water. Tank A pours into tank B as much water as tank B has; then tank B pours into tank A as much as tank A then has. Now the tanks hold the same amount. How much did each tank hold at first?

Your work:

Problem 26

Hùng puts 36 marbles into three boxes. He moves from box 1 into box 2 as many marbles as box 2 has, then from box 2 into box 3 as many as box 3 has. Now the three boxes hold the same number. How many marbles were in each box at first?

Your work:

Problem 27

Hòa, Bình and Việt have 70 cards. Hòa gives Bình 5 cards, Bình gives Việt 7, then Việt gives Hòa 9. Now Hòa and Bình have the same number, and each has twice as many as Việt. How many cards did each have at first?

Your work:

Problem 28

A woman sells half of her mangoes and 2 more; then she sells half of the rest and 3 more. She has 5 mangoes left. How many mangoes did she have?

Your work:

Problem 29

Ân and Bảo have 64 marbles. Ân gives Bảo as many as Bảo has; then Bảo gives Ân as many as Ân has; then Ân again gives Bảo as many as Bảo has. Now they have the same number. How many did each have at first?

Your work:

Problem 30

On the first day $\frac{1}{4}$ of the water in a tank is used; on the second day $\frac{1}{3}$ of what is left is used. 60 litres remain. How much water was in the tank at first?

Your work:

Challenge – Extension

Problem 31 **

How many numbers from 1 to 30 are divisible by 2, by 3 or by 5? How many are divisible by none of them?

Your work:

Problem 32 *

In a class of 40, 25 pupils like Maths and 28 like Literature. What is the least number of pupils who can like both? The greatest?

Your work:

Problem 33 *

45 pupils each belong to at least one of three clubs A, B, C. Club A has 24 members, B has 22, C has 20; 9 pupils are in A and B, 7 in B and C, 8 in C and A. How many are in all three clubs?

Your work:

Problem 34 **

In a school contest team, 30 pupils do Maths, 24 do English and 20 do Science. 46 pupils do Maths or English, 38 do English or Science, 42 do Science or Maths, and nobody does all three.

a) How many do Maths and English? **b)** English and Science? **c)** Science and Maths?

d) How many pupils are in the team?

Your work:

Problem 35 *

In a class, 8 pupils like both dogs and cats, 5 like neither, and 14 like dogs. The number who like only cats is twice the number who like only dogs. How many pupils are in the class, and how many like cats?

Your work:

Problem 36 *

How many numbers from 1 to 100 are divisible by 3 but not by 4?

Your work:

Problem 37 **

Each pupil in a group does at least one of three sports A, B, C: 55 do A, 45 do B and 40 do C. 20 pupils do exactly two sports and 5 do all three. How many pupils are in the group?

Your work:

Problem 38 *

Of 50 pupils, 35 can swim and 30 can play chess.

a) At least how many pupils can do both? **b)** If exactly 4 pupils can do neither, how many can do both?

Your work:

Problem 39 **

Quân, Sơn and Tùng have 48 marbles. Quân takes half of his marbles and shares them equally between the other two; then Sơn does the same with half of the marbles he then has; finally Tùng

does the same. Now the three have the same number. How many did each have at first?

Your work:

Problem 40

There are three drums of oil A, B, C. The oil in drum A is split into 3 equal parts: one part is poured into B and one into C. Then the oil now in B is split into 4 equal parts: one part is poured into A and one into C. Then the oil now in C is split into 3 equal parts: one into A and one into B. Now A holds 40 litres, B 46 litres and C 18 litres. How much oil was in each drum at first?

Your work:

Problem 41

Lan reads a book. On day one she reads $\frac{1}{3}$ of the book and 4 more pages; on day two, half of the remaining pages and 6 more; on day three, the last 24 pages. How many pages has the book?

Your work:

Problem 42 **

Three boxes I, II, III hold some sweets. First, box I gives boxes II and III each as many sweets as each already holds. Then box II gives boxes I and III each as many as each then holds. Now box I has 20 sweets, box II 30 and box III 40. How many sweets did each box hold at first?

Your work:

Problem 43 *

Bình spends $\frac{1}{4}$ of his money on books, then $\frac{2}{5}$ of the remaining money on a bag, then 15 000 dong on snacks. He has 30 000 dong left. How much money did he have at first?

Your work:

Problem 44 *

Mai says: "Multiply my age by 3, add 12, divide by 5 and take away 4: you get 5." How old is Mai?

Your work:

Problem 45 **

40 pupils each join at least one of three clubs: Reading 22, Science 18, Dance 20. 3 pupils join all three. How many pupils join exactly two clubs? Exactly one?

Your work:

Problem 46 ⋆⋆

In a class, $\frac{3}{5}$ of the pupils like Maths, $\frac{1}{2}$ like English, $\frac{1}{4}$ like both, and 6 pupils like neither. How many pupils are in the class?

Your work:

Problem 47 ⋆

A shop sells 40% of its rice in the morning and 50% of the rest in the afternoon. 66 kg are left. How much rice did the shop have?

Your work:

Problem 48 ⋆

An, Bình, Chi and Dũng have 100 cards. An gives Bình 3, Bình gives Chi 5, Chi gives Dũng 7, and Dũng gives An 9. Now all four have the same number. How many did each have at first?

Your work:

Problem 49 ⋆

How many two-digit numbers contain at least one digit 5?

Your work:

Problem 50 ★★

An, Bình and Chi play three games. The loser of each game gives each of the other two as many marbles as that player already has. An loses game 1, Bình loses game 2 and Chi loses game 3. At the end An has 16, Bình 24 and Chi 32 marbles. How many did each have at first?

Your work:

13 The Supposition Method

① The idea of the supposition method

Many problems talk about **two kinds** of things mixed together: chickens and rabbits, adult and child tickets, notes of two values, big and small boats,... We know

- the **total number** of things, and
- the **total of some other quantity** (legs, wheels, money, seats,...), where each thing of the first kind has one value and each thing of the second kind has another.

The supposition method ("suppose for a moment"):

1. *Suppose* that all the things are of **one kind**, and work out the total in that case.
2. Compare with the real total: how much **too few** (or **too many**) is it?
3. Swapping *one* thing of that kind for *one* thing of the other kind changes the total by the **difference of the two values**.
4. Number of swaps = (amount too few or too many) : (change per swap). The number of swaps is the number of things of the *other* kind.

The supposition is *not* true: it is only a temporary step that makes the problem easy. The answer does not depend on which kind we suppose, so the problem can be solved in two ways. Always **check** the answer against both conditions.

② Problems with penalty points

In a test or a game, a right answer **earns** a points and a wrong answer **loses** b points. Suppose every answer is right. Each time a right answer is swapped for a wrong one, the score falls by

$$a + b \text{ points} \quad \text{(it loses the } a \text{ points it would have earned } \textit{and} \text{ the } b \text{ penalty points).}$$

A question left unanswered (worth 0) makes the score fall by only a. The same idea fits wages with fines, deliveries with breakages, and so on.

③ When a difference is given instead of a sum

Sometimes the problem gives the **difference** between the totals of the two kinds (for example: *the chickens have* 6 *more legs than the rabbits*). Suppose all the things are of the first kind; then the difference is as large as possible. Swapping one thing of the first kind for one of the second kind makes the first total smaller by a *and* the second total larger by b, so the difference falls by

$$a + b.$$

④ Three kinds, or an extra condition

- If two kinds are tied together (e.g. *as many bicycles as tricycles*), put them in **groups** and treat each group as one "thing".
- If there are three kinds, use one condition to separate one kind from the other two, then use the supposition method again on the other two.

Example 1

A farm has chickens and rabbits: 32 heads and 94 legs in all. How many chickens and how many rabbits are there?

Guided solution.

Method 1. Suppose all 32 animals were chickens. There would be $32 \times 2 = 64$ legs.
That is $94 - 64 = 30$ legs too few.
Swapping one chicken for one rabbit adds $4 - 2 = 2$ legs.
Number of rabbits: $30 : 2 = 15$.
Number of chickens: $32 - 15 = 17$.
Method 2. Suppose all 32 animals were rabbits: $32 \times 4 = 128$ legs, which is $128 - 94 = 34$ legs too many.
Swapping one rabbit for one chicken takes away 2 legs, so chickens: $34 : 2 = 17$; rabbits: $32 - 17 = 15$.
Check: $17 \times 2 + 15 \times 4 = 34 + 60 = 94$.
Answer: 17 chickens, 15 rabbits.

Example 2

A school buys 45 circus tickets for 954 000 dong. An adult ticket costs 30 000 dong and a child ticket 18 000 dong. How many tickets of each kind does the school buy?

Guided solution.

Suppose all 45 tickets were child tickets: $18\,000 \times 45 = 810\,000$ dong.
That is $954\,000 - 810\,000 = 144\,000$ dong too little.
Swapping a child ticket for an adult ticket adds $30\,000 - 18\,000 = 12\,000$ dong.
Adult tickets: $144\,000 : 12\,000 = 12$.
Child tickets: $45 - 12 = 33$.
Answer: 12 adult tickets, 33 child tickets.

Example 3

A maths quiz has 25 questions. Each right answer earns 4 points and each wrong answer loses 2 points. Phương answers every question and scores 64 points. How many questions does Phương get right?

Guided solution.

Suppose all 25 answers were right: $4 \times 25 = 100$ points.
Phương has $100 - 64 = 36$ points fewer.
Each wrong answer (instead of a right one) costs $4 + 2 = 6$ points.
Wrong answers: $36 : 6 = 6$.
Right answers: $25 - 6 = 19$.
Check: $19 \times 4 - 6 \times 2 = 76 - 12 = 64$.
Answer: 19 questions.

Example 4

There are 30 chickens and rabbits. The chickens have 6 more legs than the rabbits. How many of each are there?

Guided solution.

Suppose all 30 animals were chickens: the chickens would have $30 \times 2 = 60$ legs and the rabbits 0, a difference of 60 legs.
The real difference is 6, so it must fall by $60 - 6 = 54$ legs.
Swapping one chicken for one rabbit: the chickens lose 2 legs and the rabbits gain 4, so the difference falls by $2 + 4 = 6$ legs.
Rabbits: $54 : 6 = 9$.
Chickens: $30 - 9 = 21$.
Check: $21 \times 2 - 9 \times 4 = 42 - 36 = 6$.
Answer: 21 chickens, 9 rabbits.

Example 5

A bicycle park holds 36 vehicles: bicycles (2 wheels), tricycles (3 wheels) and cars (4 wheels), with 114 wheels in all. There are as many bicycles as tricycles. How many vehicles of each kind are there?

Guided solution.

Put one bicycle and one tricycle in a *group*: a group has 2 vehicles and $2 + 3 = 5$ wheels.
Suppose there were no cars at all: $36 : 2 = 18$ groups, with $5 \times 18 = 90$ wheels.
That is $114 - 90 = 24$ wheels too few.
Swapping one group for 2 cars keeps the number of vehicles and adds $2 \times 4 - 5 = 3$ wheels.
Swaps: $24 : 3 = 8$, so there are $2 \times 8 = 16$ cars.
Groups left: $18 - 8 = 10$, i.e. 10 bicycles and 10 tricycles.
Check: $10 + 10 + 16 = 36$ vehicles; $20 + 30 + 64 = 114$ wheels.
Answer: 10 bicycles, 10 tricycles, 16 cars.

Practice

Problem 1

A yard has chickens and dogs: 25 heads and 70 legs. How many chickens and how many dogs are there?

Your work:

Problem 2

A car park has 40 vehicles, motorbikes (2 wheels) and cars (4 wheels), with 104 wheels in all. How many cars are there?

Your work:

Problem 3

Grandma gives Khôi 18 notes of 10 000 dong and 20 000 dong, worth 250 000 dong in all. How many notes of each kind are there?

Your work:

Problem 4

12 boats take 58 people across a lake, every boat full. A big boat seats 6 people and a small boat 4. How many boats of each kind are there?

Your work:

Problem 5

The 36 pupils of class 5A plant 120 trees. Each boy plants 4 trees and each girl 3 trees. How many boys and girls are there?

Your work:

Problem 6

15 lorries carry 59 tonnes of rice in one trip, every lorry full. Some carry 3 tonnes and the others 5 tonnes. How many lorries of each kind are there?

Your work:

Problem 7

Ducks and goats have 48 heads and 136 legs. How many of each are there?

Your work:

Problem 8

A quiz has 20 questions: 5 points for each right answer and 1 point off for each wrong one. Nga answers all of them and scores 76. How many does she get right?

Your work:

Problem 9

A crate holds 30 bottles of juice, some of 0.5 litre and some of 1.5 litres, 27 litres in all. How many bottles of each size are there?

Your work:

Problem 10

Tuấn buys 24 stamps, some at 3 000 dong and some at 5 000 dong, and pays 92 000 dong. How many of each does he buy?

Your work:

Problem 11

A classroom has 21 desks: some seat 2 pupils and some seat 3. When 50 pupils sit down, every seat is taken. How many desks of each kind are there?

Your work:

Problem 12

A box holds 22 spiders (8 legs each) and ants (6 legs each), with 152 legs in all. How many spiders are there?

Your work:

Problem 13

A piggy bank holds 30 coins of 500 dong and 1 000 dong, worth 21 000 dong. How many coins of each kind are there?

Your work:

Problem 14

In a basketball match a team scores 26 baskets, some worth 2 points and some worth 3 points, 60 points in all. How many 3-point baskets does it score?

Your work:

Problem 15

A worker is hired for 24 days. Each working day pays 250 000 dong and each day off costs a fine of 50 000 dong. At the end he receives 5 100 000 dong. How many days off did he take?

Your work:

Problem 16

There are 40 chickens and rabbits. The chickens have 32 more legs than the rabbits. How many of each are there?

Your work:

Problem 17

A firm delivers 500 glasses. It is paid 2 000 dong for each glass that arrives safely, but for each broken glass it is paid nothing and must pay back 8 000 dong. It receives 940 000 dong. How many glasses were broken?

Your work:

Problem 18

In 15 days Linh reads 236 pages. On some days she reads 12 pages and on the other days 20 pages. On how many days does she read 20 pages?

Your work:

Problem 19

Minh travels for 2.5 hours and covers 14 km. Part of the time he runs at 8 km per hour and the rest he walks at 4 km per hour. For how long does he run?

Your work:

Problem 20

Mum buys 8 kg of apples and oranges for 315 000 dong. Apples cost 45 000 dong per kg and oranges 30 000 dong per kg. How many kilograms of each does she buy?

Your work:

Problem 21

A tour group of 99 people travels in 9 minibuses, every seat taken. Some buses have 7 seats and some have 16 seats. How many buses of each kind are there?

Your work:

Problem 22

A test has 30 questions: 4 points for a right answer, 2 points off for a wrong answer, 0 for a question left blank. Hà leaves 4 questions blank and scores 74. How many does she get right?

Your work:

Problem 23

A drawer holds 34 notes of 2 000 dong and 5 000 dong. The 2 000 notes are worth 12 000 dong more than the 5 000 notes. How many notes of each kind are there?

Your work:

Problem 24

Using 52 matchsticks, An makes 15 separate shapes, some triangles and some squares (one matchstick per side). How many squares does he make?

Your work:

Problem 25

Hoa buys 12 pencils and pens for 64 000 dong. A pencil costs 3 000 dong and a pen 7 000 dong. How many pens does she buy?

Your work:

Problem 26

In a football league a win earns 3 points, a draw 1 point and a loss 0. A team plays 12 matches, loses none and has 28 points. How many matches does it draw?

Your work:

Problem 27

20 boxes hold 196 apples. Some boxes hold 8 apples and the others 12. How many boxes of each kind are there?

Your work:

Problem 28

A group buys 50 zoo tickets for 1 520 000 dong. An adult ticket costs 40 000 dong and a child ticket 25 000 dong. How many adults are there?

Your work:

Problem 29

In a shooting game each player fires 30 shots. A hit scores 6 points and a miss loses 3 points. Bảo scores 126 points. How many hits does he make?

Your work:

Problem 30

A car park holds 26 cars and motorbikes. The motorbikes have 4 more wheels than the cars. How many of each are there?

Your work:

Challenge – Extension

Problem 31 *

24 vehicles carry 133 people, every seat taken: motorbikes (2 wheels, 2 seats), 7-seat cars and 16-seat cars (4 wheels each). There are 64 wheels in all. How many vehicles of each kind are there?

Your work:

Problem 32 *

A company has 20 lorries of three kinds: kind A (4 wheels, carries 3 tonnes), kind B (6 wheels, 6 tonnes) and kind C (10 wheels, 6 tonnes). Together they carry 96 tonnes in one trip and have 124 wheels. How many lorries of each kind are there?

Your work:

Problem 33 **

A contest has 40 questions: 5 points for right, 2 points off for wrong, 0 for a blank. Quang scores 128 points, and he has as many wrong answers as blanks. How many does he get right?

Your work:

Problem 34 *

Lan buys 30 notebooks, some at 5 000 dong and some at 8 000 dong. She spends 45 000 dong more on the 8 000 notebooks than on the 5 000 ones. How many of each does she buy?

Your work:

Problem 35

Chickens and rabbits have 100 legs. If every chicken had 4 legs and every rabbit 2, there would be 80 legs. How many of each are there?

Your work:

Problem 36

100 cakes are shared by 100 people: each adult gets 3 cakes and every 3 children share 1 cake. How many adults and how many children are there?

Your work:

Problem 37

A car travels for 5 hours and covers 230 km: on the highway at 50 km per hour and on a country road at 30 km per hour. How many hours does it drive on the highway?

Your work:

Problem 38 *

A shop sends 1 200 eggs to market. It is paid 300 dong for every whole egg; for each broken egg it gets nothing and pays a fine of 2 700 dong. It receives 330 000 dong. How many eggs were broken?

Your work:

Problem 39 *

For 30 days Nam puts either 2 000 dong or 5 000 dong into his piggy bank each day, 117 000 dong in all. On how many days does he save 5 000 dong?

Your work:

Problem 40 **

Six teams play a round-robin tournament (each pair plays once). A win earns 3 points, a draw 1 point, a loss 0. The teams score 41 points altogether. How many matches end in a draw?

Your work:

Problem 41 **

A test has 25 questions: 4 points for right, 1 point off for wrong, 0 for a blank. An answers all and scores 65. Bình gets as many right as An, but leaves blank 3 of the questions An got wrong and gets the rest wrong. What is Bình's score?

Your work:

Problem 42

Class 5C buys 25 gifts for 380 000 dong: some at 12 000 dong and some at 20 000 dong. If they had bought the numbers the other way round, how much would they have paid?

Your work:
